## 1. Introduction

## Important notices!

- The DestinyPatch has been developed by Bananen-Joe. It is an extension for the RPG-Maker 2000, which has been developed by the company Enterbrain. This extension is not an official extension from Enterbrain.
- During the development of the patch the author acted with best knowledge and conscience, however errors are not excludable. Hence the author dissociates himself from every direct or indirect damage that could occur. Though the author is grateful for each helpful hint, which can be used to correct errors.
- The entire DestinyPatch is a free software. Each distribution with costs is illegal unless the author permits this emphatically.
- This help file refers often to external pages (e. g. like Wikipedia). The author dissociates himself from every external content, because the internet is a incessantly changing medium (e. g. everyone can edit Wikipedia articles). During development of this help file all external links were correct and assists the content of this help file with explanations, etc. Hence it is not possible in this static help file to react on external contents that has been changed.

## Embedding the patch

A detailed manual how to embed the Destiny.dll into a RPG-Maker 2000 project is included in the help file for the DestinyPatcher. The interrelationship of the programs is explained there, too. In this help file here (the one you are currently reading) is only a manual for the scripting language (DestinyScript) included!

## The layout of this help file

During development of this help file some formats have been designed and abided. These should help the user for faster navigating and getting a better overview.

## Headine

The headline is written on the upper border of each page.
The footer is on the lower border of each page. On the left of this footer is the point "< Back", which can be used to navigate to the previous page. Under this point is the headline of the previous point written. On the right of this footer is the point "Forward >", which can be used to navigate to the following page. Under this point is the headline of the previous point written. In the center of the footer is the headline of the current page written again.
Internal links inside of this help file are colored blue and not underlined unless you hover over them with the mouse cursor.
External links are colored green and always underlined. If you click on an external link then it will open a new window.

```
1 $
2 Variable = Function("String", 12345);
```

In code examples the script code is written in one box. On the left border are line numbers. The following explanations refer to them. The code itself is colored multiple times to make the terms much easier to read in refer to their meaning.

- Variables \& functions are colored blue
- Symbols are colored orange
- Numbers are colored purple
- Strings are colored red

## Information

This is a short additional piece of information, which can help you to avoid some problems.
Important additional information are written in yellow boxes.

# 2. Assembly of the scripting language 

## Calling a DestinyScript

The comment function of the RPG-Maker is used to call a DestinyScript. Because they are not only used for DestinyScripts (they are used for "common" comments, too) every DestinyScript begins with a dollar sign (\$). This symbol has been chosen because it looks like a S and the word "script" starts with a s. It is important that the first char of the RPG-Maker comments needs to be the $\$$ sign (this even means there may not be spaces or something else before the dollar sign) otherwise the RPG-Maker comment will not be interpreted as DestinyScript.
InformationIf a RPG-Maker comment should be a "common" comment, but starts with a \$ sign, it will be interpreted as DestinyScript and could show error messages. You can solve the problem if you put a space in the front of the \$ sign. So the \$ sign isn't the first symbol of the RPG-Maker comment anymore. In the RPG-Maker event command list the comment command looks like nearly the same.

## The first example

At first we create a new (empty!) RPG-Maker project. Next we modify the RPG_RT with the RPG_RT.exe so that it loads the Destiny.dll. (Version: 1.0, Language: English, MessageLink: activiated, Number of dwords: 100, Number of doubles: 100, Number of strings: 100) After generating the project we create a new event. First of all we have this code:

```
1 $
2v[1] = 5
```

We paste this code now into a new RPG-Maker comment.

| Event Commands |  |
| :---: | :---: |
| 1 2 3 |  |
| Play BGM... | Call Save Menu |
| Fade-Out BGM... | Disable Save... |
| Memorize BGM | Call Menu |
| Play Memorized BGM | Disable Menu... |
| Play Sound Effect... | Fork Conditions... |
| Play Movie... | Label... |
| Enter Password... | Goto Label... |
| Change ChipSet... | Cycle |
| Change Parallax BG... | Break Cycle |
| Encounter Rate... | Stop Parallel Eyents |
| Change Chip... | Clear Tiy fer |
| Set Teleport Place... | Call E/ent... |
| Disable Teleport... | Comment... |
| Set Escape Place... | Game Over |
| Disable Escape... | Go to Title Screen |
|  | Cancel |

This graphic can vary from the used RPG-Maker version.
We insert a MessageBox among that comment, which displays the content of the first variable. (e. g. "Variable no. 1 has the value $\operatorname{lv[1]")~}$ If we call the event in game then we get the following result:

We can see that variable no. 1 has the value 5 . But why that? All variables of
the RPG-Maker are by default initialized to 0 . And given that it is a new (and complete empty) project there must something else been happen. The answer is obvious: The DestinyScript assigned the value 5 to the variable no. 1!

## Assembly of a DestinyScript

If we take a look at the example code again and think about its result then the meaning of the script will be clear.

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=5 \\
& \hline
\end{aligned}
$$

In line no. 1 is the $\$$ sign which tells the Destiny.dll that the RPG-Maker comment should be interpreted as DestinyScript.
In line no. 2 is the command which assigns the value 5 to variable no. 1. Such a command has always the same assembly. On the left side is the destination of the operation. In this case it is variable no. 1 (hence the $\mathrm{v}[1]$ v stands for variable and [1] for the index!). In the center is the used operator. In this example this is the equal sign (=). On the right side is that what we want to assign to the destination (= source). In this case it is the number 5.
A DestinyScript may contain multiple commands. To separate them a semicolon (;) is used. A command needn't to be in a single line. But it is possible to write the entire DestinyScript into a single line (the leading \$ sign needs not its own line!).

## Information

The last command of a DestinyScript may end with a semicolon but it needn't to end with a semicolon.
As example a DestinyScript with more than one command could look like this:

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=5 ; \\
& 3 \mathrm{v}[2]=23
\end{aligned}
$$

If we execute this DestinyScript the variable no. 1 will be 5 and variable no. 2 will be 23.

## Information

Multiple commands can be written inside of a RPG-Maker comment. But the leading \$ sign is only required once. Hence the \$ sign may not be in front of each command!

It is expedient to make a important note here. If an error occurs during execution of a DestinyScript then the entire script will be aborted. This can be beneficial or even not. To avoid this you could write each command into a single RPG-Maker comment or change the error handling with the Errors object.

[^0]
## 3. Data types

## What are data types?

As a user of the RPG-Maker 2000 you already know 2 data types. At first variables and as second switches. But you can't compare a variable and a switch directly, because they save complete different values. A RPG-Maker 2000 variable can save values in the range from -999999 to +999999 (in the Destiny.dll you have a greater range - see table). But you can only use integer values (e. g. floating point numbers like 1.5 won't work!). A switch however can save only one of two values: on or off (constants: True and False). These two data types are available in different scopes (one for variables and one for switches). The Destiny.dll extends the RPG-Maker game by 3 additional scopes. At first a scope of the data type dword is added. This data type is complete identical with the data type of the variable. At second a scope of the data type double is added. This data type can save floating point numbers with a very huge range. At third a scope with the data type string is added. This data type saves text instead of numbers (e. g. names, words or complete sentences).

## List of data types

The DestinyPatch knows 7 different data types.

| Data type | Size | Range | Usage |
| :---: | :---: | :---: | :---: |
| Variable | 4 bytes | $\begin{aligned} & -2147483648 \\ & \ldots \\ & +2147483647 \end{aligned}$ | This data type is equivalent to the data type "dword" |
| Switch | lide | $0 \ldots+1$ | This data type can save only boolean values (yes or no). Usually the boolean constants True ( $=1$ ) and False ( $=0$ ) are used for this data type. |
| Dword | $4$ | -2147483648 <br> $\ldots$ <br> +2147483647 | This is the most common data type. It saves only integer values. |
| Word | 2 | -32768 ... | This data type is similar to dword, but this one has a smaller range. This data type is used only by a few methods, but its usable for data transmission. You can save traffic with it, because it needs only two bytes. This data type saves only integer values, too. |
| Byte | byte | $0 \ldots+255$ | This data type is similar to dword, but this one has a constitutive smaller range. This data type saves only very small numbers and needs hence only one byte in memory. This data type is used for pixels in a picture. This data type saves only integer values, too. |
| Double | $8$ | $\left\lvert\, \begin{array}{\|l} -1.7 \mathrm{E}+308 \ldots \\ -5.0 \mathrm{E}-324 \ldots \\ +5.0 \mathrm{E}-324 \ldots \\ +1.7 \mathrm{E}+308 \end{array}\right.$ | This data type can save very huge numbers, but in favor it requires much more space in memory. The accurancy is 15 integer/decimal places. This is the only data type that can save floating point numbers. |
| String | $4+n$ | $\begin{aligned} & \text { ca. } 0 \ldots \\ & +2147483647 \end{aligned}$ | This data type saves text (e. g. names, words or complete sentences). |

## Scopes

To save the result of an operation it is necessary to have some scopes in memory where the result can be stored. Scopes for the data types variable and switch are allocated by the RPG_RT.exe. The other scopes (for the data types dword, double and string) are allocated by the Destiny.dll. To access the scopes you can use their abbreviations.

| Abbreviation | Data type | Data source | Identifier |
| :--- | :--- | :--- | :--- |
| $\mathrm{V}[$ ] | Variable | RPG_RT.exe | V stands for variable. |
| $\mathrm{S}[$ ] | Switch | RPG_RT.exe | S stands for switch. |
| d[] | Dword | Destiny.dll | D stands for dword. |
| $\mathrm{f}[$ ] | Double | Destiny.dll | F stands for floating point number. |
| a[] | String | Destiny.dll | A stands for ANSI string. |

We have already seen how to access a variable via the v abbreviation. You simply write down the abbreviation with some brackets behind it (the brackets must be written directly after the abbreviation!). You write down the index of the element you want to access inside the brackets (e. g. v[1] for the first variable, v[2] for the second variable, ...). The same principle works with other scopes, too.

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{~d}[5]=100 ; \\
& 3 \mathrm{v}[3]=\mathrm{d}[5]
\end{aligned}
$$

If we paste this example into a RPG-Maker comment and let subsequent display the value of the variable no. 3 in a MessageBox then we can see that the variable has the value 100. In this example we assigned first the value 100 to the dword no. 5 . Subsequently we assigned the value of the dword no. 5 to the variable no. 3. On this way we assigned a value from a different scope to the variable no. 3 .

## Indirectly addressing

So far we accessed the elements of a scope only directly (e. g. v[1] for the first variable). An other way to access an element of a scope is the indirectly addressing. To do this we simply write an element of a scope instead of an immediate (fixed) number into the brackets.

```
1 $
2v[4] = 5;
3v[v[4]] = 17
```

If we execute this script and take a subsequently a look at variable no. 5 then we can see that its value is 17 . In this example we accessed variable no. 5 indirectly. First we assigned in line 2 the value 5 (the index of the variable we want to access) to the variable no. 4 . Subsequently we wrote in line 3 that we want to use the value of variable no. 4 as index instead of an immediate number.

## Information

All scopes can be addressed indirectly. The scopes used for indirectly addressing can be addressed indirectly, too (e. g. v[v[v[1]]]). The maximum depth of indirectly addressing depends on the capacity of the computer where the game is running. Usually you needn't a deeper addressing depth than 1.

## Conversion of data types

If the data types differ (e. g. if you want to assign a dword to a double) then the data types will be converted automatically. This happens inside of formulas or parameters, too. Only the mixed calculation of strings and numbers or switches and numbers raise an error. To do a calculation like this you must explictly convert the values using the Convert object.

[^1]
## 4. Number formats

## What are number formats?

Number formats are different ways to write down a number in DestinyScript. There are 4 formats total to write down a number in
DestinyScript. Three of them are known from computer science. The other format is used for our known decimal system. If we write down a number then we usually use one of the 10 digits ( $0,1,2,3,4,5,6,7,8,9$ ). Because we have 10 digits the base of this number system is 10 . If we read a number then we multiply each digit with the base exponentiated by the digit index minus 1.

In this example the circumflex is used as symbol for the exponentation.
$123=1{ }^{*} 10 \wedge 2+2{ }^{*} 10 \wedge 1+3{ }^{\wedge} 10 \wedge 0$
$123=1{ }^{*} 100+2{ }^{*} 10+3{ }^{*} 1$
$123=100+20+3$
$123=123$

A translation of a number from the decimal system into the decimal system meaningless, because the result will always be the same. However if we use two different number systems (number systems with different bases) then we get differing results. First we use the hexadecimal system. It contains 16 digits ( $0,1,2,3,4,5,6,7,8,9, A, B, C, D, E, F)$. The digits A to F equates to the numbers 10 to 15 . For example: 1 AB is a valid hexadecimal number. Translated into the decimal system it is:

In this example the circumflex is used as symbol for the exponentation.
$1 \mathrm{AB}($ hex $)=1 * 16 \wedge 2+10 * 16 \wedge 1+11 * 16 \wedge$
$0($ dec $)$
$1 \mathrm{AB}($ hex $)=1 * 256+10 * 16+11 * 1$ (dec)
$1 \mathrm{AB}($ hex $)=256+160+11$ (dec)
$1 \mathrm{AB}($ hex $)=427$ (dec)

It seems to be meaningless for the layman, but for the expert it is very helpful. If we write down such numbers we find a drastic problem: Some numbers can't be clearly related to a specific number system. For example
the number 10 in hexadecimal is not the same as the number 10 in decimal. Hence we must cleary define which number system we use. So we append a 0x as identifier in DestinyScript at the beginning of a hexadecimal number (e. g. $0 \times 123=291$ ). Something similar is used for the other number formats octal (Base: 8, Digits: 0-7, Identifier: 0o) and binary (Base: 2, Digits: 0 and 1, Identifier: 0b). For decimal numbers are no identifiers used. An important note is still that floating point numbers can only be used in the decimal number format. The point is used as decimal separator (e. g. 1.5 is a valid floating point number).

## List of number formats

DestinyScript supports 4 different number formats

| Number <br> format | Base | Floating point <br> number | Identifier | Examples |
| :--- | :--- | :--- | :--- | :--- |
| Decimal | 10 | yes | none | $11,9,10.6$, <br> 3.1415926535 |
| Hexadecimal | 16 | no | 0x | 0x10, 0xAC, 0x1237 |
| Octal | 8 | no | 0o | 0o17, 0o32, 0o700 |
| Binary | 2 | no | 0b | 0b111011, 0b00111101, <br> 0b1111110 |

Information
If we try to write down a floating point number in a different number format than the decimal system then an error occurs (e. g. 0x11.5 isn't a valid number).

## Differently calculation of integers and floating point numbers

First of all we have the following example:

$$
\begin{aligned}
& 1 \mathrm{f} \\
& 2 \mathrm{f}[1]=3 / 2 ; \\
& 3 \mathrm{f}[2]=3.0 / 2.0
\end{aligned}
$$

You could anticipate that $\mathrm{f}[1]$ and $\mathrm{f}[2]$ are equal at the end of the script, but in fact they are different: $\mathrm{f}[1]$ whould be 1 and $\mathrm{f}[2]$ whould be 1.5 at the end of the script. This difference occurs because we defined each number in line 2 as integer values. So they are divided like integers (integers don't have decimal places - hence they are not calculated). In line 3 instead we defined each number as floating point number. Hence they are calculated like floating point numbers (the decimal places are not lost). You should notice this difference if you want to calculate with floating point numbers.

Forward >
3. Data types
4. Number formats
5. Strings

## 5. Strings

## Defining strings

Strings are not numbers. However its content must be able to declare in DestinyScript without creating mistakes (e. g. a string could contain numbers which should not be interpreted like numbers). The solution is to write down the content of the string into quotes (").

```
1 \$
\(2 \mathrm{a}[1]=\) "Content of a string"
```

## Information

If you want to use quotes inside of a string then you must use the QUOTE constant (e. g. a[1] = "Hello with " + QUOTE + "quotes" + QUOTE).

## Concatentation of strings

If you want to concatenate some strings you must use the add operator. A more specific description can be found at 6 . Operators.

## Strings with multiple lines

If a string should contain multiple lines then you must use the CRLF constant.

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { "Line 1" + CRLF + "Line 2" }
\end{aligned}
$$

If you display this string into a MessageBox you will have some trouble, because the MessageBox of the RPG_RT processes lines on an other way than the Destiny.dll. A more specific description can be found at the string placeholder of the MessageLink.
4. Number formats
5. Strings

## 6. Operators

## What are operators?

Operators are signs that represent specific arithmetical or binary operations. DestinyScript supports 9 operators. The set operator is neutral, because it can be used with each data type. Furthermore there are 5 arithmetical operators (addition, subtraction, multiplication, Division and Modulo). The addition ist something special, because it can be used for the concatenation of strings, too. At last there are 3 binary operators (AND, OR and XOR).

## Set

## Description

The simpliest operator is the set operator we already know. With this operator it is possible to assign a value to a destination directly. This operator can only be used at the beginning of a command. This operator works with each data type. The equality sign (=) is used for this operator.

## Signs

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \vee[1]=1
\end{aligned}
$$

## Addition

## Description

You can add two values with the addition operator. This operator can be used at the beginning and in the rear part of a command. If you apply an addition at the beginning of a command the rear part of the command will be processed as if it is written in parentheses. If this operator is used with strings then the values will be concatenated. Switches can't be added. The plus sign ( + ) is used for this operator.

## Signs

| Signs | Beginning? |
| :--- | :--- |
| + | no |
| $+=$ | yes |

## Example

```
1 \$
\(2 v[1]=1+10+100 ;\)
\(3 \mathrm{v}[1]+=20\);
\(4 \mathrm{a}[1]=\) "Joe";
\(5 \mathrm{a}[2]=\) "Hello " + a[1]
```

The variable no. 1 whould be 131 at the end and the string no. 2 whould be "Hello Joe".

## Information

If you use the addition operator to concatenate strings then you may only use strings. For example this command whould raise an error:
$a[1]=$ "Number equals " + v[1]
Instead all data types must be converted to strings first if you concatenate them. This command whould be valid:
a[1] = "Number equals " + Convert.String(v[1])
The Convert object is used here.
$\qquad$

## Subtraction

## Example

You can subtract two values with the subtraction operator. This operator can be used at the beginning and in the rear part of a command. If you apply a subtraction at the beginning of a command the rear part of the command will be processed as if it is written in parentheses. Strings and switches can't be subtracted. The minus sign (-) is used for this operator.

## Signs

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \vee[1]=50-7 ; \\
& 3 \vee[1]-=9
\end{aligned}
$$

The variable no. 1 whould be 34 at the end.

## Multiplication

## Description

You can multiply two values with the multiplication operator. This operator can be used at the beginning and in the rear part of a command. If you apply a multiplication at the beginning of a command the rear part of the command will be processed as if it is written in parentheses. Strings and switches can't be multiplied. The multiplication sign (*) is used for this operator.

## Signs

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=7 * 3 ; \\
& 3 \mathrm{v}[1] *=3
\end{aligned}
$$

The variable no. 1 whould be 63 at the end.

## Division

## Description

You can divide two values with the division operator. This operator can be used at the beginning and in the rear part of a command. If you apply a division at the beginning of a command the rear part of the command will be processed as if it is written in parentheses. Strings and switches can't be divided. If you divide through zero an error will occur. The division slash (/) is used for this operator.

## Signs

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=100 / 10 ; \\
& 3 \mathrm{v}[1] /=2
\end{aligned}
$$

The variable no. 1 whould be 5 at the end.

## Modulo

## Description

In the modulo operation the left value will be divided by the right value (integer division) and the remainder will be returned (this is the part of the left number, which whould be required to build the decimal part of the result). This operation can be used at the beginning and in the rear part of a command. If you apply a modulo operation at the beginning of a command the rear part of the command will be processed as if it is written in parentheses. Strings and switches can't be divided. If you divide through zero an error will occur. The percent sign (\%) is used for this operation.

## Signs

| Signs | Beginning? |
| :--- | :--- |
| $\%$ | no |
| $\%=$ | yes |

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=100 \% 3 ; \\
& 3 \mathrm{v}[2]=99 ; \\
& 4 \mathrm{v}[2] \%=10
\end{aligned}
$$

The variable no. 1 whould be 1 at the end and variable no. 2 whould be 9 .

## AND operator

## Description

You can apply a binary AND operation with two values via the AND operator (this means that every bit is AND operated). This operation can be used at the beginning and in the rear part of a command. If you apply an AND operation at the beginning of a command the rear part of the command will be processed as if it is written in parentheses. Strings, switches and doubles can't be AND operated. The ampersand sign (\&) is used for this operation.

## Sings

| Sings | Beginning? |
| :--- | :--- |
| $\&$ | no |
| $\&=$ | yes |

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=100 \& 7 ; \\
& 3 \mathrm{v}[2]=31 ; \\
& 4 \mathrm{v}[2] \&=255
\end{aligned}
$$

The variable no. 1 whould be 4 at the end and variable no. 2 whould be 31.

## OR operation

## Description

You can apply a binary OR operation with two values via the OR operator (this means that every bit is OR operated). This operation can be used at the beginning and in the rear part of a command. If you apply an OR operation at the beginning of a command the rear part of the command will be processed as if it is written in parentheses. Strings, switches and doubles can't be OR operated. The pipe sign ( | ) is used for this operation.

## Signs

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \vee[1]=7 \mid 3 ; \\
& 3 \vee[2]=1 ; \\
& 4 \vee[2] \mid=100
\end{aligned}
$$

The variable no. 1 whould be 7 at the end and variable no. 2 whould be 101 .

## XOR operation

## Description

You can apply a binary EXCLUSIVE OR operation (XOR) with two values via the XOR operator (this means that every bit is XOR operated). This operation can be used at the beginning and in the rear part of a command. If you apply a XOR operation at the beginning of a command the rear part of the command will be processed as if it is written in parentheses. Strings, switches and doubles can't be XOR operated. The circumflex sign ( $\wedge$ ) is used for this operation.

## Signs

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=27 \wedge 13 ; \\
& 3 \mathrm{v}[2]=1 ; \\
& 4 \mathrm{v}[2] \wedge=3
\end{aligned}
$$

The variable no. 1 whould be 22 at the end and variable no. 2 whould be 2 .

## 7. Leading signs

## Description

There are three leading signs in DestinyScript totally: two arithmetical (Plus and Minus) as soon as a binary (NOT). Please notice that every sign must be directly at the beginning of each values/scopes/parentheses. The data types switch and string cannot be used with leading signs.

## Plus sign

## Description

The plus sign has only been introduced to make it easier to copy numbers. It doesn't change the number. The plus sign ( + ) is used for this leading sign.

| Sign |
| :--- |
| + |

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=0++1
\end{aligned}
$$

The variable no. 1 whould be 1 at the end.

## Minus sign

## Description

You can define negative numbers by using the minus sign (if you use an integer value the two's complement will be formed). The minus sign (-) is used for this leading sign.

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=5+-3 ; \\
& 3 \mathrm{v}[2]=10--11
\end{aligned}
$$

The variable no. 1 whould be 2 at the end and variable no. 2 whould be 21.

## Information

The mathematical law "minus minus is plus" is used here, too.

## NOT sign

## Description

You can negate a value with the NOT sign (the ones' complement will be formed). The tilde sign ( $\sim$ ) is used for this leading sign. This leading sign can't be used with doubles.

| Sign |
| :--- |
| $\sim$ |

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\sim 100
\end{aligned}
$$

The variable no. 1 whould be -101 at the end.
Information
According to the boolean algebra is not not the same as the value without
any not sign before it (= Identity)!

## 8. Formulas

## Formulas (generic)

After we know the data types, number formats, strings, operators and leading signs we know (nearly) all what's required to use formulas in DestinyScript. The last missing parts are parentheses and priorities of the operators.

## Priorities

## Description

According to the arithmetical algebra it is necessary: point operations (multiplication, division) will be executed before stroke operations (addition, subtraction). And according to the boolean algebra is necessary: AND will be executed before OR. A combination of these laws forms the priorities of the operators. If a formula contain multiple partial calculations then they are calculated in the order that result from their priorities. If more than one partial calculation have the same priority then they are calculated from left to right. Leading signs (plus, minus, NOT) have always the highest priority.

$$
\begin{aligned}
& x=15+3 * 9 \\
& x=15+21 \\
& x=36
\end{aligned}
$$

In this example the point operation (3*9) has been calculated before the stroke operation (which whould be $15+3$ ) was calculated.

## List of the priorities

In the following list applies: the higher the number the higher the priority.

| Operator | Priority |
| :--- | :--- |
| AND operation | 4 |
| OR operation | 3 |
| XOR operation | 3 |
| Modulo | 2 |
| Division | 2 |
| Multiplication | 2 |
| Subtraction | 1 |
| Addition | 1 |

## Example

The following example uses the signs of DestinyScript but it is just a calcuation example - it is not a valid DestinyScript.

In this example some lines could have been calculated in a single step, but to make it easier to understand the calculation has been made step-by-step.

## Parentheses

## Description

If a partial calculation with less priority should be calculated before a partial calculation with high priority then you must put the calculation with less priority in parentheses ().

## Example

The following example uses the signs of DestinyScript but it is just a calcuation example - it is not a valid DestinyScript.

$$
\begin{aligned}
& x=100 *-(10+7) \\
& x=100 *-17 \\
& x=-1700
\end{aligned}
$$

Information
A sign at the beginning of a pair of parentheses modifies only the result of the calculation in the parentheses.

## 9. Objects

## Description

Objects are that what represents the DestinyPatch. All functions and properties of the RPG-Maker 2000 game (and even those of the Destiny.dll) are bunched into objects. These functions (further called methods) and properties can be accessed via the relevant object. For example you can access the keyboard using the Keyboard object. So you can use the object to check the key states. As already said an object can contain two types of content: methods and properties. Those content types are formatted differently. Methods are always write-protected, properties only sometimes (see the definition of the relative property).

## Syntax

The syntax to call an object is always the same:

```
1 $
2v[1] = Objectname.Functionname(Parameter1,
3...);
4 Objectname.Functionname(Parameter1, ...);
5v[2] = Objectname.Propertyname;
v[3] = Objectname[Index].Propertyname
```

In this example you see several ways to access the content of an object. One thing is always the same: first you write down the object name, then a dot and at last the function or property name. Between this identifiers you may not use any spaces.
If you call a method (Line 2) you must add a pair of parentheses which must be written directly after the method name (this means without spaces). Inside of these parentheses you write the parameters (if there are some). To separate the parameters you use the comma. If you call a method you must always write down the parentheses even if the method has no parameters! The result of the method (= return value) can be used in a formula (e. g. the return value will be stored into variable no. 1 at line 2).
Sometimes a method has no return value (Line 3). In this case you can't access its return value in formulas.
If you access a property (Line 4) you do it like a method call (but without the parentheses and the parameters).
Some objects or properties have an index (Line 5). This index identifies which element of the object/property should be accessed. The index is written into a pair of brackets [ ]. Like the parentheses they are written directly after the object name/property name (this means without spaces). If an index has more than one dimension (e. g. a two dimensional array) then you separate the indices with a comma.

## Information

If a data type in a parameter differs from the specified one (e. g. the data type string is required and the data type dword is used) then the used parameter is converted to the required data type automatically (e.g.
dword is converted into string). You needn't to call an extra conversion method. (Example: v[1] = String.Length(d[1]); )

## Examples

```
1 $
2v[1] = Keyboard.GetKey();
3 Keyboard.SetKeyState(VK_RIGHT,
4 KEYEVENTF_KEYDOWN);
5v[2] = Time.Day;
6v[3] = Picture[1].Width;
7v[4] = Map.Lower[2, 3];
8v[5] = 5 - Math.Abs(v[6]);
Mouse.X = 10
```

In line 2 is a habitually method call (without parameters). The return value (in this case it is the last pressed key) will be stored into the variable no. 1. In line 3 is a method without return value (but with parameters) called (in this case the key state will be set).
In line 4 a property is requested. The property value (in this case the number of the current day of the month) will be stored into variable no. 2. In line 5 a property of an object is requested which requires an index. The property value (in this case the width of picture no. 1) will be stored into variable no. 3.
In line 6 the value of a property (which has a two dimensional index) of an object is requested. The property value (in this case number of the chip at position 2, 3) will be stored into variable no. 4.
In line 7 a method is called (with parameters) inside of a formula. The return value of the method (in this case the absolute value of variable no. 6) will be subtracted from the number 5 and then stored into variable no. 5 . In line 8 the value 10 will be assigned to the property of an object (in this case the x coordinate of the mouse cursor).

## Information

The upper/lower case of object/method/property names are irrelevant. OBJECTNAME.PROPERTY, objectname.property or even oBjEcTnAmE.PrOpErTy cause all the same.

## Alphabetical list of objects

| Objectname | Short description |
| :--- | :--- |
| Actor | List of heroes |
| Client | Connections via internet/network |
| Convert | Converting of different data types |
| Destiny | Current options of the Destiny.dll |
| Directory | Listing directories and abstract file system operations |
| Error | Handling of single errors |
| Errors | Handling of all errors |
| Event | List of events (EventID) |
| File | Reading/writing files |
| Game | The current game |
| Keyboard | Key queries |
| Logic | Logical operations and comparisons |
| Map | Current map |
| MapEvent | List of events (serially numbered) |
| Math | Miscellaneous mathematical functions |
| Mouse | Cursor position |
| Picture | List of pictures |
| Server | Incoming connections via internet/network |
| String | Miscellaneous string functions |
| Time | Time queries |
|  |  |

9. Objects

Forward >
9.1 Destiny object

### 9.1 Destiny object

## Description

The Destiny object represents the Destiny.dll and can be used to query the version of the Destiny.dll, setting up the language, as soon as saving/loading the scopes of Destiny.dll.

## List of methods/properties

| Name | Type | Short description |
| :--- | :--- | :--- |
| VersionMajor | Property | The integer part of the used Destiny.dll version |
| VersionMinor | Property | The decimal part of the used Destiny.dll |
| version |  |  |

## VersionMajor

## Description

Returns the integer part of the used Destiny.dll version. For example if a version 3.4 whould be available and the version 1.2 whould be used this property whould return 1.

## Syntax

1 Destiny.VersionMajor

## Data type

Dword

## Type

Property, read-only

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Destiny.VersionMajor }
\end{aligned}
$$

On Destiny.dll version 1.0 v[1] whould be at end: 1

## VersionMinor

## Description

Returns the decimal part of the used Destiny.dll version. For example if a version 3.4 whould be available and the version 1.2 whould be used this property whould return 2.

## Syntax

1 Destiny.VersionMinor

## Data type

Dword

## Type

Property, read-only

## Example

$$
\begin{aligned}
& 1 \text { \$ } \\
& 2 \mathrm{v}[1]=\text { Destiny.VersionMinor }
\end{aligned}
$$

On Destiny.dll version 1.0 v[1] whould be at end: 0

## DIIVersionMajor

## Description

Returns the integer part of the available Destiny.dll version. For example if a version 3.4 whould be available and the version 1.2 whould be used this property whould return 3.

## Syntax

1 Destiny.DllVersionMajor

## Data type

Dword

## Type

Property, read-only

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Destiny.DllVersionMajor }
\end{aligned}
$$

On Destiny.dll version 1.0 v[1] whould be at end: 1

## DIIVersionMinor

## Description

Returns the decimal part of the available Destiny.dll version. For example if a version 3.4 whould be available and the version 1.2 whould be used this property whould return 4.

## Syntax

1 Destiny.DllVersionMinor

## Data type

Dword

## Type

Property, read-only

## Example

$$
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Destiny.DllVersionMinor }
\end{aligned}
$$

On Destiny.dll version 1.0 v[1] whould be at end: 0

## Language

## Description

This is the chosen language of the Destiny.dll. If you change this value you change the language of the error messages, too.

## Syntax

## 1 Destiny. Language

## Data type

Dword

## Type

Property

## Range

0: Language German
1: Language English

## Example

```
1 $
2 Destiny.Language = 1
```

At the end all error messages whould be english.

## Save

## Description

Saves all scopes of the Destiny.dll (dwords, doubles and strings) into a file.
The file will be stored into the game directory and has the name SaveXX.dsd (XX will be replaced with the slot in two digit format).

## Syntax

1 Destiny.Save(Slot)

## Return value

None

## Type

Method

## Parameter: Slot

## Description

The number of the save slot.

## Data type

Dword

## Range

0 to 99

## Example

## 1 \$ <br> 2 Destiny.Save(1)

At the end all $\mathrm{d}[. .],. \mathrm{f}[. .$.$] and \mathrm{a}[. .$.$] scopes whould be saved in the file$ Save01.dsd.

## Load

## Description

Loads the scopes of the Destiny.dll (dwords, doubles and strings) from a file. The file is stored into the game directory and has the name SaveXX.dsd (XX will be replaced with the slot in two digit format).

## Syntax

```
1 Destiny. Load(Slot)
```

## Return value

None

## Type

Method

## Parameter: Slot

## Description

The number of the save slot.

## Data type

Dword

## Range

0 to 99

## Example

1 \$
2 Destiny. Load (1)
At the end all d[...], f[...] and a[...] scopes whould be loaded from the file Save01.dsd.
9.1 Destiny object

Forward >
9.2 Game object

### 9.2 Game object

## Description

The Game object represents the RPG_RT.exe and can be used to save/load the game or even quit it.

## List of methods/properties

| Name | Type | Short description |
| :--- | :--- | :--- |
| Save | Method | Saves the game |
| Load | Method | Loads the game |
| Quit | Method | Quits the game |

## Save

## Description

Saves the current game into a file. The file will be stored into the game directory and has the name SaveXX.Isd (XX will be replaced with the slot in two digit format). The scopes of the Destiny.dll won't be saved with this method. If the game can't save the RPG_RT.exe will display an error message and crash. Something more specific can be found at known bugs.

## Syntax

## 1 Game.Save(Slot)

## Return value

None

## Type

Method

## Parameter: Slot

## Description

The number of the save slot.

Data type

Dword

Range

0 to 99

## Example

| 1 \$ |
| :--- |
| 2 Game.Save(1) |

At the end the game whould be saved (except the destiny scopes) into the file Save01.lsd.

## Load

## Description

Loads the current game from a file. The file is stored into the game directory and has the name SaveXX.lsd (XX will be replaced with the slot in two digit format). The scopes of the Destiny.dll won't be loaded with this method. If the game can't be loaded the RPG_RT.exe will show an error message and crash. Something more specific can be found at known bugs.

It's strongly recommended that you use an actual version of the
Destiny.dll, because this command doesn't work reliably on older versions of Destiny.dll!

## Syntax

1 Game. Load(Slot)

## Return value

None

## Type

Method

## Parameter: Slot

## Description

The number of the save slot.

## Data type

## Dword

## Range

0 to 99

## Example

## 1 \$ <br> 2 Game. Load(1)

At the end the game whould be loaded (except the destiny scopes) from the file Save01.lsd.

## Quit

## Description

Quits the current game and returns to Windows.

## Syntax

## 1 Game. Quit ( )

## Return value

None

## Type

Method

## Example

## 1 \$ <br> 2 Game. Quit ()

At the end the game whould exit.

### 9.3 Convert object

## Description

You can convert data types with the Convert object.

## List of methods/properties

| Name | Type | Short description |
| :--- | :--- | :--- |
| DecimalComma | Property | Specifies wether a comma or a point is used for <br> decimal separation |
| Byte | Method | Converts to the data type byte |
| Word | Method | Converts to the data type word |
| Dword | Method | Converts to the data type dword |
| Double | Method | Converts to the data type double |
| Switch | Method | Converts to the data type switch |
| String | Method | Converts to the data type string |
| Angle | Method | Converts between different angle formats |

## DecimalComma

## Description

If this switch is activated then a comma is used for decimal separation instead of a point. This property affects only conversion from double to string.

## Syntax

## 1 Convert. DecimalComma

## Data type

Switch

## Type

Property

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \text { Convert. DecimalComma = True }
\end{aligned}
$$

## Byte

## Description

Converts each data type into the data type byte.

## Syntax

## 1 Convert.Byte(Number)

## Return value

Byte

## Type

Method

## Parameter: Number

## Description

The number which should be converted.

Data type
All

Range

0 to 255
Example

| $1 \$$ |
| :--- |
| $\mathrm{~d}[1]=$ convert. Byte(v[1]) |

## Word

## Description

Converts each data type into the data type word.

## Syntax

## 1 Convert.Word(Number)

## Return value

Word
Type
Method

## Parameter: Number

## Description

The number which should be converted.

Data type

All

Range
-32768 to 32767

## Example

## Dword

## Description

Converts each data type into the data type dword.

## Syntax

1 Convert. Dword(Number)

## Return value

Dword

## Type

Method

## Parameter: Number

## Description

The number which should be converted.

Data type

All

Range
-2147483648 to 2147483647
Example

## Double

## Description

Converts each data type into the data type double.

## Syntax

1 Convert. Double(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which should be converted.

Data type

All

Range
$-1.7 \mathrm{E}+308$ to $+1.7 \mathrm{E}+308$
Example

| $1 \$$ |
| :--- |
| $2 \mathrm{f}[1]=$ Convert. Double(v[1]) |

## Switch

## Description

Converts each data type into the data type switch.

## Syntax

## 1 Convert.Switch(Number)

## Return value

Switch

## Type

Method

## Parameter: Number

## Description

The number which should be converted.

Data type
All

Range

0 to 1

## Example

| $1 \$$ |
| :--- |
| $\mathrm{~s}[1]=$ convert. $\operatorname{switch}(\mathrm{v}[1])$ |

## String

## Description

Converts each data type into the data type string.

## Syntax

## 1 Convert.String(Number)

## Return value

String
Type
Method

## Parameter: Number

## Description

The number which should be converted.

Data type

All

Range

All valid numbers
Example

| $1 \mathrm{\$}$ |
| :--- |
| $2 \mathrm{a}[1]=$ convert.String $(\mathrm{v}[1])$ |

## Angle

## Description

Converts an angle from one format into an other. To specifiy the angle formats used you can use the angle format constants. (For a more specific description of the angle formats see Sin method of the Math object)

## Syntax

1 Convert.Angle(Angle, FormatFrom, FormatTo)

## Return value

Double

## Type

Method

## Parameter: Angle

## Description

The angle which should be converted.

## Data type

Double

## Range

All valid angles

## Parameter: FormatFrom

## Description

The angle format which is currently used for the angle.

## Data type

Dword

## Range

1 to 4 (Constants: DEG, RAD, GRAD and RPG)

## Parameter: FormatTo

## Description

The angle format which shall be converted to.

## Data type

Dword

## Range

1 to 4 (Constants: DEG, RAD, GRAD and RPG)

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Convert.Angle(90, DEG, RPG) }
\end{aligned}
$$

[^2]
# 9.4 Logic object 

## Description

With the Logic object you can apply logical operations with switches and comparisons with numbers. Additionally you can return different values conditioned by a switch via the If method.

## List of methods/properties

| Name | Type | Short description |
| :--- | :--- | :--- |
| Not | Method | Reverses the value of a switch |
| And | Method | Applys a logical AND operation with two switches |
| Or | Method | Applys a logical OR operations with two switches |
| Xor | Method | Applys a logical XOR operation with two switches |
| Xnor | Method | Applys a logical XNOR operation with two switches |
| Nand | Method | Applys a logical NAND operation with two switches |
| Nor | Method | Applys a logical NOR operation with two switches |
| Imp | Method | Applys a logical implication operation with two <br> switches |
| Inh | Method | Applys a logical inhibit operation with two switches |
| And3 | Method | Applys a logical AND operation with three switches |
| Or3 | Method | Applys a logical OR operation with three switches |
| Xor3 | Method | Applys a logical XOR operation with three switches |
| Xnor3 | Method | Applys a logical XNOR operation with three <br> switches |
| Nand3 | Method | Applys a logical NAND operation with three <br> switches |
| Nor3 | Method | Applys a logical NOR operation with three switches <br> Above <br> Method | | Checks whether a value is greater than an other |
| :--- |
| value |

| Unequal | Method | Checks whether a value isn't equal to an other value |
| :--- | :--- | :--- |
| If | Method | Returns one of two values conditioned by a switch |

## Not

## Description

Returns the reversed value of a switch.

## Syntax

## 1 Logic.Not(Switch1)

## Truth table

## Return value

Switch
Type
Method

## Parameter: Switch1

## Description

The switch which shall be reversed.

## Data type

Switch

## Example

## And

## Description

Applys a logical AND operation with two switches.

## Syntax

1 Logic.And(Switch1, Switch2)

## Truth table

## Return value

Switch
Type
Method

## Parameter: Switch1

## Description

The first switch which shall be operated.

## Data type

## Switch

## Parameter: Switch2

## Description

The second switch which shall be operated.
Data type

Switch

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{~s}[1]=\text { Logic.And(True, False) }
\end{aligned}
$$

s[1] whould be at end: 0 (= False)

## Or

## Description

Applys a logical OR operation with two switches.

## Syntax

1 Logic. Or(Switch1, Switch2)

## Truth table

## Return value

Switch
Type
Method

## Parameter: Switch1

## Description

The first switch which shall be operated.

## Data type

## Switch

## Parameter: Switch2

## Description

The second switch which shall be operated.
Data type

Switch

## Example

```
1 $
2s[1] = Logic.Or(False, True)
```

s[1] whould be at end: 1 (= True)

## Xor

## Description

Applys a logical XOR operation with two switches.

## Syntax

1 Logic. Xor(Switch1, Switch2)

## Truth table

## Return value

Switch
Type
Method

## Parameter: Switch1

## Description

The first switch which shall be operated.

## Data type

## Switch

## Parameter: Switch2

## Description

The second switch which shall be operated.
Data type

Switch

## Example

```
1 $
2s[1] = Logic.Xor(True, True)
```

s[1] whould be at end: 0 (= False)

## Xnor

## Description

Applys a logical XNOR operation (equivalence) with two switches.

## Syntax

1 Logic. Xnor(Switch1, Switch2)

## Truth table

## Return value

Switch
Type
Method

## Parameter: Switch1

## Description

The first switch which shall be operated.

## Data type

## Switch

## Parameter: Switch2

## Description

The second switch which shall be operated.
Data type

Switch

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{~s}[1]=\text { Logic.Xnor(False, False) }
\end{aligned}
$$

s[1] whould be at end: 1 (= True)

## Nand

## Description

Applys a logical NAND operation with two switches.

## Syntax

1 Logic. Nand(Switch1, Switch2)

## Truth table

## Return value

Switch
Type
Method

## Parameter: Switch1

## Description

The first switch which shall be operated.

## Data type

## Switch

## Parameter: Switch2

## Description

The second switch which shall be operated.
Data type

Switch

## Example

```
1 $
2 s[1] = Logic.Nand(True, True)
```

s[1] whould be at end: 0 (= False)

## Nor

## Description

Applys a logical NOR operation with two switches.

## Syntax

## 1 Logic.Nor(Switch1, Switch2)

## Truth table

## Return value

Switch
Type
Method

## Parameter: Switch1

## Description

The first switch which shall be operated.

## Data type

## Switch

## Parameter: Switch2

## Description

The second switch which shall be operated.
Data type

Switch

## Example

```
1 $
2 s[1] = Logic.Nor(True, False)
```

s[1] whould be at end: 0 (= False)

## Imp

## Description

Applys a logical implication operation with two switches.

## Syntax

1 Logic.Imp(Switch1, Switch2)

## Truth table

## Return value

Switch
Type
Method

## Parameter: Switch1

## Description

The first switch which shall be operated.

## Data type

## Switch

## Parameter: Switch2

## Description

The second switch which shall be operated.
Data type

Switch

## Example

```
1 $
2 s[1] = Logic.Imp(False, True)
```

s[1] whould be at end: 1 (= True)

## Inh

## Description

Applys a logical inhibit operation with two switches.

## Syntax

1 Logic.Inh(Switch1, Switch2)

## Truth table

## Return value

Switch
Type
Method

## Parameter: Switch1

Description
The first switch which shall be operated.

## Data type

## Switch

## Parameter: Switch2

## Description

The second switch which shall be operated.
Data type

Switch

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{~s}[1]=\text { Logic.Inh(False, False) }
\end{aligned}
$$

s[1] whould be at end: 0 (= False)

## And3

## Description

Applys a logical AND operation with three switches.

## Syntax

1 Logic.And3(Switch1, Switch2, Switch3)

## Truth table

| Switch1 | Switch2 | Switch3 | Return value |
| :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 0 |
| 0 | 0 | 1 | 0 |
| 0 | 1 | 0 | 0 |
| 0 | 1 | 1 | 0 |
| 1 | 0 | 0 | 0 |
| 1 | 0 | 1 | 0 |
| 1 | 1 | 0 | 0 |
| 1 | 1 | 1 | 1 |

## Return value

Switch
Type
Method

## Parameter: Switch1

## Description

The first switch which shall be operated.

## Data type

Switch

## Parameter: Switch2

## Description

The second switch which shall be operated.

## Data type

Switch

## Parameter: Switch3

## Description

The third switch which shall be operated.

## Data type

Switch

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{~s}[1]=\text { Logic.And3(True, True, True) }
\end{aligned}
$$

s[1] whould be at end: 1 (= True)

## Or3

## Description

Applys a logical OR operation with three switches.

## Syntax

1 Logic. Or3(Switch1, Switch2, Switch3)

## Truth table

| Switch1 | Switch2 | Switch3 | Return value |
| :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 0 |
| 0 | 0 | 1 | 1 |
| 0 | 1 | 0 | 1 |
| 0 | 1 | 1 | 1 |
| 1 | 0 | 0 | 1 |
| 1 | 0 | 1 | 1 |
| 1 | 1 | 0 | 1 |
| 1 | 1 | 1 | 1 |

## Return value

Switch
Type

Method

## Parameter: Switch1

## Description

The first switch which shall be operated.

## Data type

Switch

## Parameter: Switch2

## Description

The second switch which shall be operated.

## Data type

Switch

## Parameter: Switch3

## Description

The third switch which shall be operated.

## Data type

Switch

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{~s}[1]=\text { Logic.Or3(False, False, True) }
\end{aligned}
$$

s [1] whould be at end: 0 (= True)

## Xor3

## Description

Applys a logical XOR operation with three switches.

## Syntax

1 Logic. Xor3(Switch1, Switch2, Switch3)

## Truth table

| Switch1 | Switch2 | Switch3 | Return value |
| :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 0 |
| 0 | 0 | 1 | 1 |
| 0 | 1 | 0 | 1 |
| 0 | 1 | 1 | 0 |
| 1 | 0 | 0 | 1 |
| 1 | 0 | 1 | 0 |
| 1 | 1 | 0 | 0 |
| 1 | 1 | 1 | 0 |

## Return value

Switch
Type
Method

## Parameter: Switch1

## Description

The first switch which shall be operated.

## Data type

Switch

## Parameter: Switch2

## Description

The second switch which shall be operated.

## Data type

Switch

## Parameter: Switch3

## Description

The third switch which shall be operated.

## Data type

Switch

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{~s}[1]=\text { Logic.Xor3(True, True, True) }
\end{aligned}
$$

s[1] whould be at end: 0 (= False)

## Xnor3

## Description

Applys a logical XNOR operation (equivalence) with three switches.

## Syntax

1 Logic. Xnor3(Switch1, Switch2, Switch3)

## Truth table

| Switch1 | Switch2 | Switch3 | Return value |
| :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 1 |
| 0 | 0 | 1 | 0 |
| 0 | 1 | 0 | 0 |
| 0 | 1 | 1 | 0 |
| 1 | 0 | 0 | 0 |
| 1 | 0 | 1 | 0 |
| 1 | 1 | 0 | 0 |
| 1 | 1 | 1 | 1 |

## Return value

Switch
Type
Method

## Parameter: Switch1

## Description

The first switch which shall be operated.

## Data type

Switch

## Parameter: Switch2

## Description

The second switch which shall be operated.

## Data type

Switch

## Parameter: Switch3

## Description

The third switch which shall be operated.

## Data type

Switch

## Example

```
1 $
2 s[1] = Logic.Xnor3(False, False, False)
```

s[1] whould be at end: 1 (= True)

## Nand3

## Description

Applys a logical NAND operation with three switches.

## Syntax

1 Logic. Nand3(Switch1, Switch2, Switch3)

## Truth table

| Switch1 | Switch2 | Switch3 | Return value |
| :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 1 |
| 0 | 0 | 1 | 1 |
| 0 | 1 | 0 | 1 |
| 0 | 1 | 1 | 1 |
| 1 | 0 | 0 | 1 |
| 1 | 0 | 1 | 1 |
| 1 | 1 | 0 | 1 |
| 1 | 1 | 1 | 0 |

## Return value

Switch
Type
Method

## Parameter: Switch1

## Description

The first switch which shall be operated.

## Data type

Switch

## Parameter: Switch2

## Description

The second switch which shall be operated.

## Data type

Switch

## Parameter: Switch3

## Description

The third switch which shall be operated.

## Data type

Switch

## Example

```
1 $
2 s[1] = Logic.Nand3(True, True, False)
```

s [1] whould be at end: 1 (= True)

## Nor3

## Description

Applys a logical NOR operation with three switches.

## Syntax

1 Logic. Nor3(Switch1, Switch2, Switch3)

## Truth table

| Switch1 | Switch2 | Switch3 | Return value |
| :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 1 |
| 0 | 0 | 1 | 0 |
| 0 | 1 | 0 | 0 |
| 0 | 1 | 1 | 0 |
| 1 | 0 | 0 | 0 |
| 1 | 0 | 1 | 0 |
| 1 | 1 | 0 | 0 |
| 1 | 1 | 1 | 0 |

## Return value

Switch
Type

Method

## Parameter: Switch1

## Description

The first switch which shall be operated.

## Data type

Switch

## Parameter: Switch2

## Description

The second switch which shall be operated.

## Data type

Switch

## Parameter: Switch3

## Description

The third switch which shall be operated.

## Data type

Switch

## Example

```
1 $
2 s[1] = Logic.Nor3(False, True, False)
```

s[1] whould be at end: 0 (= False)

## Above

## Description

Compares two numeric values an returns true if the first value is greater than the second value.

## Syntax

1 Logic. Above(Number1, Number2)

## Return value

Switch

## Type

Method

## Parameter: Number1

## Description

The first number which shall be compared.

## Data type

All numbers

## Range

Depends on the data type

## Parameter: Number2

## Description

The second number which shall be compared.

## Data type

All numbers

## Range

Depends on the data type

## Example

$$
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{~s}[1]=\operatorname{Logic} . \operatorname{Above}(1,7) \\
& \hline
\end{aligned}
$$

$$
\text { s[1] whould be at end: } 0 \text { (= False) }
$$

## AboveEqual

## Description

Compares two numeric values an returns true if the first value is greater/equal than the second value.

## Syntax

$$
1 \text { Logic. AboveEqual(Number1, Number2) }
$$

## Return value

Switch

## Type

Method

## Parameter: Number1

## Description

The first number which shall be compared.

## Data type

All numbers

## Range

Depends on the data type

## Parameter: Number2

## Description

The second number which shall be compared.

## Data type

All numbers

## Range

Depends on the data type

## Example

$$
\begin{aligned}
& 1 \text { 1\$ } \\
& 2 \mathrm{~s}[1]=\operatorname{Logic.AboveEqual}(6,6) \\
& \hline
\end{aligned}
$$

$$
\text { s[1] whould be at end: } 1 \text { (= True) }
$$

## Below

## Description

Compares two numeric values an returns true if the first value is smaller than the second value.

## Syntax

1 Logic. Below(Number1, Number2)

## Return value

Switch

## Type

Method

## Parameter: Number1

## Description

The first number which shall be compared.

## Data type

All numbers

## Range

Depends on the data type

## Parameter: Number2

## Description

The second number which shall be compared.

## Data type

All numbers

## Range

Depends on the data type

## Example

$$
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{~s}[1]=\operatorname{Logic.\operatorname {Below}(1,20)}
\end{aligned}
$$

s [1] whould be at end: 1 (= True)

## BelowEqual

## Description

Compares two numeric values an returns true if the first value is smaller/equal than the second value.

## Syntax

$$
1 \text { Logic. BelowEqual(Number1, Number2) }
$$

## Return value

Switch

## Type

Method

## Parameter: Number1

## Description

The first number which shall be compared.

## Data type

All numbers

## Range

Depends on the data type

## Parameter: Number2

## Description

The second number which shall be compared.

## Data type

All numbers

## Range

Depends on the data type

## Example

$$
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{~s}[1]=\operatorname{Logic} . \operatorname{Be} \operatorname{lowEqual}(71,2)
\end{aligned}
$$

[^3]
## Equal

## Description

Compares two numeric values an returns true if the first value equals to the second value.

## Information

This method compares only numbers. If you want to compare string then you must use the Compare method of the String object. If you want to compare switches then you must use the Xnor method of this object.

## Syntax

1 Logic.Equal(Number1, Number2)

## Return value

Switch

## Type

Method

## Parameter: Number1

## Description

The first number which shall be compared.

## Data type

All numbers

## Range

Depends on the data type

## Parameter: Number2

## Description

The second number which shall be compared.

## Data type

All numbers

## Range

Depends on the data type

## Example

```
1 $
2s[1] = Logic.Equal(7, 6)
```

s[1] whould be at end: 0 (= False)

## Unequal

## Description

Compares two numeric values an returns true if the first value doesn't equal to the second value.

> Information
> This method compare only numbers. If you want to compare strings for inequality then you must use the Compare method of the String object and reverse the result with the Not method of this object. If you want to compare switches for inequality then you must use the Xor method of this object.

## Syntax

## 1 Logic.Unequal(Number1, Number2)

## Return value

Switch

## Type

Method

## Parameter: Number1

## Description

The first number which shall be compared.

## Data type

All numbers

## Range

Depends on the data type

## Parameter: Number2

## Description

The second number which shall be compared.

## Data type

All numbers

## Range

Depends on the data type

## Example

| 1\$ <br> 2 <br> [1] $=\operatorname{Logic.} . \operatorname{Unequal}(12,8)$ <br> s[1] whould be at end: 1 (= True) |
| :--- |

## If

## Description

Returns a value conditioned by the value of a switch. If the switch is True then TrueValue will be returned, otherwise FalseValue will be returned.

## Information

The values including the data types of the parameters will be returned. However you can't use this method for a writing operation.

## Syntax

1 Logic.If(Expression, TrueValue, FalseValue)

## Return value

Either TrueValue or FalseValue (depends on the value of Expression).

## Type

Method

## Parameter: Expression

## Description

Decides whether TrueValue or FalseValue returns.

## Data type

Switch

## Parameter: TrueValue

## Description

Will be returned only if Expression is true.

## Data type

All

## Parameter: FalseValue

## Description

Will be returned only if Expression is false.

## Data type

## All

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { Logic.If(True, "marmalade", "cake") }
\end{aligned}
$$

a[1] whould be at end: "marmalade"
< Back
Forward >
9.3 Convert object

### 9.5 Math object

## Description

You can apply many mathematical operations (trigonometry, logarithmize, square root, rounding, ...) with the Math object.

## List of methods/properties

| Name | Type | Short description |
| :--- | :--- | :--- |
| Pi | Property | Returns Ludolph's number ( $\pi=3,141592653589 \ldots$ ). |
| E | Property | Returns Euler's number (e $=2,718281828 \ldots .)$. |
| Abs | Method | Returns the absolute value of a number |
| Sin | Method | Calculates the sine of an angle |
| Cos | Method | Calculates the cosine of an angle |
| Tan | Method | Calculates the tangent of an angle |
| Cot | Method | Calculates the cotangent of an angle |
| Sec | Method | Calculates the sekant of an angle |
| Csc | Method | Calculates the cosekant of an angle |
| ASin | Method | Calculates the angle of a sine |
| ACos | Method | Calculates the angle of a cosine |
| ATan | Method | Calculates the angle of a tangent |
| ACot | Method | Calculates the angle of a cotangent |
| ASec | Method | Calculates the angle of a sekant |
| ACsc | Method | Calculates the angle of a cosekant |
| SinH | Method | Calculates the hyperbolic sine |
| CosH | Method | Calculates the hyperbolic cosine |
| TanH | Method | Calculates the hyperbolic tangent |
| CotH | Method | Calculates the hyperbolic cotangent |
| SecH | Method | Calculates the hyperbolic sekant |
| CscH | Method | Calculates the hyperbolic cosekant |
| ASinH | Method | Calculates the inverted hyperbolic sine |
| ACosH | Method | Calculates the inverted hyperbolic cosine |
| ATanH | Method | Calculates the inverted hyperbolic tangent |
| ACotH | Method | Calculates the inverted hyperbolic cotangent |
| ASecH | Method | Calculates the inverted hyperbolic sekant |
|  |  |  |

| ACscH | Method | Calculates the inverted hyperbolic cosekant |
| :--- | :--- | :--- |
| Power | Method | Exponentiates a base with an exponent |
| Log | Method | Calculates the logarithm to any base |
| Lg | Method | Calculates the decade logarithm (base: 10) |
| Ln | Method | Calculates the natural logarithm (base: e $=$ <br> $2,718281828 . .)$. |
| Lb | Method | Calculates the binary logarithm (base: 2) |
| Sqrt | Method | Calculates the square root of a number |
| Cmp | Method | Compares two values |
| Exp | Method | Exponates the number 10 with an exponent |
| Round | Method | Rounds a number halfway away from zero |
| RoundUp | Method | Rounds a number in direction to $+\infty$ |
| RoundDown | Method | Rounds a number in direction to - $\infty$ |
| Int | Method | Cuts the decimal places of a number |
| Scale | Method | Cuts the integer places of a number |

## Pi

## Description

This property represents Ludolph's number ( $\pi=3,141592653589 .$. ).

## Syntax

## 1 Math.Pi

## Data type

Double

## Type

Property, read-only

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Math.Pi }
\end{aligned}
$$

f[1] whould be at end: 3,141592653589...

## $E$

## Description

This property represents Euler's number ( $\mathrm{e}=2,718281828 . .$. ).

## Syntax

## 1 Math . E

## Data type

Double

## Type

Property, read-only

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Math.E }
\end{aligned}
$$

f[1] whould be at end: 2,718281828...

## Abs

## Description

Returns the absolute value of a number (this means the leading sign will always be plus).

## Syntax

```
1 Math.Abs(Number)
```

## Return value

Double
Type
Method

## Parameter: Number

## Description

The number whose absolute value shall be returned.

## Data type

Double

## Example

```
1 $
2f[1] = Math.Abs(-2)
```

$\mathrm{f}[1]$ whould be at end: 2

## Sin

## Description

Calculates the sine of an angle (= opposite leg / hypotenuse). You can specify the angle in one of four angle formats: DEG, RAD, GRAD and RPG. These names are specified as constants and can be used directly as parameter. DEG stands for degree and means that a full circle has 360 angle units. RAD stands for radiant and means that the radian measure (a full circle has $\pi$ angle units) is used. GRAD stands for grad and means that a full circle has 400 angle units. RPG is a RPG-Maker specific format and means that a full circle has 256 angle units.

## Syntax

1 Math.Sin(Angle, Format)

## Return value

Double
Type
Method

## Parameter: Angle

## Description

The angle which shall be calculated.

## Data type

Double

## Parameter: Format

## Description

The current format of the angle.

## Data type

Dword

## Range

1 to 4 (Constants: DEG, RAD, GRAD and RPG)

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\operatorname{Math} . \operatorname{Sin}(90, \mathrm{DEG})
\end{aligned}
$$

$\mathrm{f}[1]$ whould be at end: 1

## Cos

## Description

Calculates the cosine of an angle (= adjacent leg / hypotenuse). (For a description of the angle formats see Sin method)

## Syntax

```
1 Math.Cos(Angle, Format)
```

## Return value

Double

## Type

Method

## Parameter: Angle

## Description

The angle which shall be calculated.

## Data type

Double

## Parameter: Format

Description

The current format of the angle.

## Data type

Dword

## Range

1 to 4 (Constants: DEG, RAD, GRAD and RPG)

## Example

```
1 $
2f[1] = Math.Cos(Math.Pi, RAD)
```

f [1] whould be at end: -1

## Tan

## Description

Calculates the tangent of an angle (= opposite leg / adjacent leg). (For a description of the angle formats see Sin method)

## Syntax

$$
1 \text { Math. Tan(Angle, Format) }
$$

## Return value

Double
Type
Method

## Parameter: Angle

## Description

The angle which shall be calculated.

## Data type

Double

## Parameter: Format

Description
The current format of the angle.

## Data type

Dword

## Range

1 to 4 (Constants: DEG, RAD, GRAD and RPG)

## Example

```
1 $
2 f[1] = Math.Tan(50, GRAD)
```

$\mathrm{f}[1]$ whould be at end: 1

## Cot

## Description

Calculates the cotangent of an angle (= adjacent leg / opposite leg). (For a description of the angle formats see Sin method)

## Syntax

```
1 Math.Cot(Angle, Format)
```

## Return value

Double

## Type

Method

## Parameter: Angle

## Description

The angle which shall be calculated.

## Data type

Double

## Parameter: Format

## Description

The current format of the angle.

## Data type

Dword

## Range

1 to 4 (Constants: DEG, RAD, GRAD and RPG)

## Example

```
1 $
2f[1] = Math.Cot(96, RPG)
```

f [1] whould be at end: -1

## Sec

## Description

Calculates the sekant of an angle (= hypotenuse / adjacent leg). (For a description of the angle formats see Sin method)

## Syntax

```
1 Math.Sec(Angle, Format)
```

## Return value

Double
Type
Method

## Parameter: Angle

## Description

The angle which shall be calculated.

## Data type

Double

## Parameter: Format

## Description

The current format of the angle.

## Data type

Dword

## Range

1 to 4 (Constants: DEG, RAD, GRAD and RPG)

## Example

```
1 $
2f[1] = Math.Sec(45, DEG)
```

$\mathrm{f}[1]$ whould be at end: 1,414213562373...

## Csc

## Description

Calculates the cosekant of an angle (= hypotenuse / opposite leg). (For a description of the angle formats see Sin method)

## Syntax

$$
1 \text { Math.Csc(Angle, Format) }
$$

## Return value

Double
Type
Method

## Parameter: Angle

## Description

The angle which shall be calculated.

## Data type

Double

## Parameter: Format

## Description

The current format of the angle.

## Data type

Dword

## Range

1 to 4 (Constants: DEG, RAD, GRAD and RPG)

## Example

```
1 $
2f[1] = Math.Csc(30, DEG)
```

$\mathrm{f}[1]$ whould be at end: 2

## ASin

## Description

Calculates the angle from a sine (= arc sine). (For a description of the angle formats see Sin method)

## Syntax

$$
1 \text { Math.Asin(Sine, Format) }
$$

## Return value

Double
Type
Method

## Parameter: Sine

## Description

The sine value.

## Data type

Double

## Parameter: Format

Description
The target angle format.

## Data type

Dword

## Range

1 to 4 (Constants: DEG, RAD, GRAD and RPG)

## Example

```
1 $
2 f[1] = Math.Asin(30, DEG)
```

f[1] whould be at end: 30

## ACos

## Description

Calculates the angle from a cosine (arc cosine). (For a description of the angle formats see Sin method)

## Syntax

$$
1 \text { Math.Acos(Cosine, Format) }
$$

## Return value

Double
Type
Method

## Parameter: Cosine

## Description

The cosine value.

## Data type

Double

## Parameter: Format

Description

The target angle format.

## Data type

Dword

## Range

1 to 4 (Constants: DEG, RAD, GRAD and RPG)

## Example

```
1 $
2f[1] = Math.Acos(1, GRAD)
```

$\mathrm{f}[1]$ whould be at end: 0

## ATan

## Description

Calculates the angle from a tangent (= arc tangent). (For a description of the angle formats see Sin method)

## Syntax

$$
1 \text { Math.Atan(Tangent, Format) }
$$

## Return value

Double
Type
Method

## Parameter: Tangent

## Description

The tangent value.

## Data type

Double

## Parameter: Format

Description
The target angle format.

## Data type

Dword

## Range

1 to 4 (Constants: DEG, RAD, GRAD and RPG)

## Example

```
1 $
2f[1] = Math.Atan(1, DEG)
```

$\mathrm{f}[1]$ whould be at end: 45

## ACot

## Description

Calculates the angle from a cotangent (= arc cotangent). (For a description of the angle formats see Sin method)

## Syntax

$$
1 \text { Math.Acot(Cotangent, Format) }
$$

## Return value

Double
Type
Method

## Parameter: Cotangent

## Description

The cotangent value.

## Data type

Double

## Parameter: Format

Description
The target angle format.

## Data type

Dword

## Range

1 to 4 (Constants: DEG, RAD, GRAD and RPG)

## Example

```
1 $
2f[1] = Math.Acot(-1, DEG)
```

$\mathrm{f}[1]$ whould be at end: 135 (= -45)

## ASec

## Description

Calculates the angle from a sekant (= arc sekant). (For a description of the angle formats see Sin method)

## Syntax

$$
1 \text { Math.Asec(Sekant, Format) }
$$

## Return value

Double
Type
Method

## Parameter: Sekant

## Description

The sekant value.

## Data type

Double

## Parameter: Format

Description

The target angle format.

## Data type

Dword

## Range

1 to 4 (Constants: DEG, RAD, GRAD and RPG)

## Example

```
1 $
2f[1] = Math.Asec(2, DEG)
```

$\mathrm{f}[1]$ whould be at end: 60

## ACsc

## Description

Calculates the angle from a cosekant (= arc cosekant). (For a description of the angle formats see Sin method)

## Syntax

$$
1 \text { Math.Acsc(Cosekant, Format) }
$$

## Return value

Double
Type
Method

## Parameter: Cosekant

## Description

The cosekant value.

## Data type

Double

## Parameter: Format

Description

The target angle format.

## Data type

Dword

## Range

1 to 4 (Constants: DEG, RAD, GRAD and RPG)

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\operatorname{Math} \cdot \operatorname{Acsc}(1, \mathrm{RPG})
\end{aligned}
$$

$\mathrm{f}[1]$ whould be at end: 64

## SinH

## Description

Calculates the hyperbolic sine.

## Syntax

## 1 Math.Sinh(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which shall be calculated.

## Data type

Double

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Math.Sinh(f[2]) }
\end{aligned}
$$

## CosH

## Description

Calculates the hyperbolic cosine.

## Syntax

## 1 Math.Cosh(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which shall be calculated.

## Data type

Double

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Math. } \operatorname{Cosh}(\mathrm{f}[2])
\end{aligned}
$$

## TanH

## Description

Calculates the hyperbolic tangent.

## Syntax

## 1 Math.Tanh(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which shall be calculated.

## Data type

Double

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Math. } \operatorname{Tanh}(\mathrm{f}[2])
\end{aligned}
$$

## CotH

## Description

Calculates the hyperbolic cotangent.

## Syntax

## 1 Math. Coth(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which shall be calculated.

## Data type

Double

## Example

```
1 $
2f[1] = Math.Coth(f[2])
```

## SecH

## Description

Calculates the hyperbolic sekant.

## Syntax

## 1 Math.Sech(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which shall be calculated.

## Data type

Double

## Example

```
1 $
2f[1] = Math.Sech(f[2])
```

## CscH

## Description

Calculates the hyperbolic cotangent.

## Syntax

## 1 Math.Csch(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which shall be calculated.

## Data type

Double

## Example

```
1 $
2f[1] = Math.Csch(f[2])
```

## ASinH

## Description

Calculates the inverted hyperbolic sine (area hyperbolic sine).

## Syntax

## 1 Math.Asinh(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which shall be calculated.

## Data type

Double

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Math.Asinh(f[2]) }
\end{aligned}
$$

## ACosH

## Description

Calculates the inverted hyperbolic cosine (area hyperbolic cosine).

## Syntax

## 1 Math.Acosh(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which shall be calculated.

## Data type

Double

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Math. } \operatorname{Acosh}(\mathrm{f}[2])
\end{aligned}
$$

## ATanH

## Description

Calculates the inverted hyperbolic tangent (area hyperbolic tangent).

## Syntax

## 1 Math.Atanh(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which shall be calculated.

## Data type

Double

## Example

$$
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{f}[1]=\text { Math.Atanh(f[2]) }
\end{aligned}
$$

## ACotH

## Description

Calculates the inverted hyperbolic cotangent (area hyperbolic cotangent).

## Syntax

## 1 Math.Acoth(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which shall be calculated.

## Data type

Double

## Example

$$
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{f}[1]=\text { Math.Acoth(f[2]) }
\end{aligned}
$$

## ASecH

## Description

Calculates the inverted hyperbolic sekant (area hyperbolic sekant).

## Syntax

## 1 Math.Asech(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which shall be calculated.

## Data type

Double

## Example

$$
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{f}[1]=\text { Math.Asech(f[2]) }
\end{aligned}
$$

## ACscH

## Description

Calculates the inverted hyperbolic cosekant (area hyperbolic cosekant).

## Syntax

## 1 Math.Acsch(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which shall be calculated.

## Data type

Double

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Math. } \operatorname{Acsch}(\mathrm{f}[2])
\end{aligned}
$$

## Power

## Description

Exponentiates the base with the exponent.
Syntax
1 Math. Power(Base, Exponent)

## Return value

Double

## Type

Method

## Parameter: Base

## Description

The base value.

## Data type

Double

## Parameter: Exponent

## Description

The exponent value.

## Data type

Double

## Example

| $1 \mathrm{\$}$ |
| :--- |
| $2 \mathrm{f}[1]=$ Math. $\operatorname{Power}(3,4)$ |

f[1] whould be at end: $81(=3 * 3 * 3 * 3)$

## Log

## Description

Calculates the logarithm of any base.

## Syntax

## 1 Math.Log(Number, Base)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number whose logarithm shall be calculated.

Data type

Double

## Parameter: Base

Description

The base of the logarithm.

## Data type

Double

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\operatorname{Math} \cdot \log (25,5)
\end{aligned}
$$

$\mathrm{f}[1]$ whould be at end: 2

## Lg

## Description

Calculates the decade logarithm (the base is 10 ).

## Syntax

## 1 Math. Lg(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number whose logarithm shall be calculated.

## Data type

Double

## Example

```
1 $
2f[1] = Math.Lg(1000)
```

$\mathrm{f}[1]$ whould be at end: 3

## Ln

## Description

Calculates the natural logarith (the base is Euler's number).

## Syntax

## 1 Math.Ln(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number whose logarithm shall be calculated.

## Data type

Double

## Example

```
1 $
2f[1] = Math.Ln(1 / Math.E)
```

f [1] whould be at end: -1

## Lb

## Description

Calculates the binary logarithm (the base is 2).

## Syntax

## 1 Math.Lb(Number)

## Return value

Double
Type
Method

## Parameter: Number

## Description

The number whose logarithm shall be calculated.

## Data type

Double

## Example

```
1 $
2 f[1] = Math.Lb(256)
```

f[1] whould be at end: 8

## Sqrt

## Description

Calculates the square root of a number.

## Syntax

## 1 Math.Sqrt(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number whose square root shall be calculated.

## Data type

Double

## Example

$$
\begin{aligned}
& 1 \mathrm{\$} \\
& 2 \mathrm{f}[1]=\text { Math.Sqrt(10000) }
\end{aligned}
$$

f[1] whould be at end: 100

## Cmp

## Description

Compares two numbers. If the first number is smaller than the second number then the result will be $<0$. If the first number is greater than the second number then the result will be $>0$. If both numbers are the same then the result will be $=0$.

## Syntax

$$
1 \text { Math.Cmp(Number1, Number2) }
$$

## Return value

Dword

## Type

Method

## Parameter: Number1

## Description

The first number to compare.

## Data type

Double

## Parameter: Number2

The second number to compare.

## Data type

Double

## Example

```
1 $
2d[1] = Math.Cmp(1, 2)
```

f [1] whould be at end: -1

## Exp

## Description

Exponentiates the number 10 with the specified number.

## Syntax

## 1 Math.Exp(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The exponent for the number 10.

## Data type

Double

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Math. } \operatorname{Exp}(5)
\end{aligned}
$$

f[1] whould be at end: 100000

## Round

## Description

Rounds a number halfway away from zero (this means 5 to 9 will be rounded up) to the specified place. If you specify 0 as place then the decimal part will be rounded to the integer part. If you specify a positive number as place then you round to that decimal place. If you specify a negative number as place then you round to that integer place.

## Syntax

$$
1 \text { Math.Round(Number, Place) }
$$

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which shall be rounded.

Data type

Double

## Parameter: Place

## Description

The place which shall be rounded (measured from the decimal separator).

## Data type

Dword

## Example

```
1 $
2 f[1] = Math.Round(3.345, 2)
```

f[1] whould be at end: 3.35

## RoundUp

## Description

Rounds a number into the direction of $+\infty$ (this means from 1 to 9 will be rounded up) to the specified place. If you specify 0 as place then the decimal part will be rounded to the integer part. If you specify a positive number as place then you round to that decimal place. If you specify a negative number as place then you round to that integer place.

## Syntax

$$
1 \text { Math. RoundUp(Number, Place) }
$$

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which shall be rounded.

Data type

Double

## Parameter: Place

## Description

The place which shall be rounded (measured from the decimal separator).

## Data type

Dword

## Example

$$
\begin{aligned}
& 1 \$ \mathrm{f} \\
& 2 \mathrm{f}[1]=\text { Math.RoundUp }(-300.7,0)
\end{aligned}
$$

$\mathrm{f}[1]$ whould be at end: -300 (if you round into the direction of $+\infty$ then the result will always be more positive)

## RoundDown

## Description

Rounds a number into the direction of $-\infty$ (this means from 1 to 9 will be rounded down) to the specified place. If you specify 0 as place then the decimal part will be rounded to the integer part. If you specify a positive number as place then you round to that decimal place. If you specify a negative number as place then you round to that integer place.

## Syntax

$$
1 \text { Math.RoundDown(Number, Place) }
$$

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number which shall be rounded.

Data type

Double

## Parameter: Place

## Description

The place which shall be rounded (measured from the decimal separator).

## Data type

Dword

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Math.RoundDown(592.001, }-2)
\end{aligned}
$$

f[1] whould be at end: 500

## Int

## Description

Cuts the decimal part of a number.

## Syntax

## 1 Math.Int (Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number whose decimal part shall be removed.

## Data type

Double

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Math.Int }(123.456)
\end{aligned}
$$

$\mathrm{f}[1]$ whould be at end: 123

## Scale

## Description

Cuts the integer part of a number.

## Syntax

## 1 Math.Scale(Number)

## Return value

Double

## Type

Method

## Parameter: Number

## Description

The number whose integer part shall be removed.

## Data type

Double

## Example

$$
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{f}[1]=\text { Math.Scale(123.456) }
\end{aligned}
$$

$\mathrm{f}[1]$ whould be at end: 0,456
9.4 Logic object

### 9.6 String object

## Description

You can manipulate (cut, search, compare, ...) strings with the String object.

## Liste of methods/properties

| Name | Type | Short description |
| :--- | :--- | :--- |
| Length | Method | Returns the length of a string |
| LTrim | Method | Truncates spaces from the left side of a string |
| RTrim | Method | Truncates spaces from the right side of a string |
| Trim | Method | Truncates spaces from both sides (left and right) |
| of a string |  |  |

## Length

## Description

Returns the number of chars in a string.

## Syntax

## 1 String.Length(String)

## Return value

Dword

## Type

Method

## Parameter: String

## Description

The string whose length shall be determined.

## Data type

String

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{~d}[1]=\text { String.Length("7 Chars") }
\end{aligned}
$$

d[1] whould be at end: 7

## LTrim

## Description

Truncates spaces (this means chars with the ASCII code 32) from the left side of a string.

## Syntax

## 1 String.LTrim(String)

## Return value

String
Type
Method

## Parameter: String

## Description

The string whose spaces shall be removed from the left side.

## Data type

String

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { String.Trim(" Text with spaces left } \\
& \text { and right ") }
\end{aligned}
$$

$\mathrm{a}[1]$ whould be at end: "Text with spaces left and right "
$\qquad$

## RTrim

## Description

Truncates spaces (this means chars with the ASCII code 32) from the right side of a string.

## Syntax

```
1String.RTrim(String)
```

## Return value

String

## Type

Method

## Parameter: String

## Description

The string whose spaces shall be removed from the right side.

## Data type

String

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { String.Trim(" Text with spaces left } \\
& \text { and right ") }
\end{aligned}
$$

a[1] whould be at end: " Text with spaces left and right"
$\qquad$

## Trim

## Description

Truncates spaces (this means chars with the ASCII code 32) from both sides (left and right) of a string.

## Syntax

$$
1 \text { String.Trim(String) }
$$

## Return value

String

## Type

Method

## Parameter: String

## Description

The string whose spaces shall be removed from the left and right side.

## Data type

String

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \text { a[1] = String.Trim(" Text with spaces left } \\
& \text { and right ") }
\end{aligned}
$$

a[1] whould be at end: "Text with spaces left and right"
$\qquad$

## Chr

## Description

Creates a string from an ASCII code.

## Syntax

## 1 String.Chr(Char)

## Return value

String

## Type

Method

## Parameter: Char

## Description

The ASCII code of the char. The ASCII code 0 isn't valid.

## Data type

Byte

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { String.Chr (65) }
\end{aligned}
$$

a[1] whould be at end: "A"

## Ord

## Description

Returns the ASCII code of a char at a specified position in a string.

## Syntax

## 1 String.Ord(String, Position)

## Return value

Byte

## Type

Method

## Parameter: String

## Description

The string which contains the char.

## Data type

String

## Parameter: Position

## Description

The position of the char in the string. This is the offset from the start of the string (this means 0 whould be the first char, 1 whould be the second
char, ...).

## Data type

Dword

## Example

$$
\begin{aligned}
& 1 \$ \text { S } \\
& 2 \mathrm{~d}[1]=\text { String.Ord("Text", 2) }
\end{aligned}
$$

$\mathrm{d}[1]$ whould be at end: 120 (this is the ASCII code of the char "x")

## Pos

## Description

Returns the position of a partial string in an other string. The return value is the offset from the start of the string (this means 0 whould be the first char, 1 whould be the second char, ...). This method returns -1 if the string couldn't be found.

## Syntax

1 String.Pos(String, SearchString, StartPosition)

## Return value

Dword

## Type

Method

## Parameter: String

## Description

The string which contains SearchString (haystack).
Data type

String

## Parameter: SearchString

## Description

The string which shall be searched (needle).

## Data type

String

## Parameter: StartPosition

## Description

The position where the search shall start. This value is the offset from the start of the string (this means 0 whould start at the first char, 1 whould start at the second char, ...).

## Data type

Dword

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{~d}[1]=\text { String.Pos("Search me!", "e", 2) }
\end{aligned}
$$

d[1] whould be at end: 7 (the first "e" has been skipped because the search started at char no. 3)

## SubStr

## Description

Returns a partial string with specified length at a specified position.

## Syntax

$$
1 \text { String.SubStr(String, Position, Length) }
$$

## Return value

String
Type
Method

## Parameter: String

## Description

The string which contains the partial string.

Data type

String

## Parameter: Position

## Description

The start position where of the partial string. This value is the offset from the start of the string (this means 0 whould start at the first char, 1 whould
start at the second char, ...).

## Data type

Dword

## Parameter: Length

## Description

The length of the partial string. If this value is greater than the remainder of the string (or if it is a negative value) then the entire remainder will be copied.

## Data type

Dword

## Example

```
1 $
2a[1] = String.SubStr("Text with parts", 5,
    4)
```

a[1] whould be at end: "with"

## Compare

## Description

Compares two strings and returns true if they are equal (otherwise false).

## Syntax

## 1 String.Compare(String1, String2)

## Return value

Switch
Type
Method

## Parameter: String1

## Description

The first string which shall be compared.

Data type

String

## Parameter: String2

Description

The second string which shall be compared.

## Data type

String

## Example

| 1 \$ |  |
| :--- | :--- |
| 2 | $\mathrm{~s}[1]=$ String.Compare("Text", "Text") |

s[1] whould be at end: 1 (= True)

## Replace

## Description

Replaces all occurences of a partial string in an other string.

## Syntax

> 1 String.Compare(Expression, Search, Replacement)

## Return value

String

## Type

Method

## Parameter: Expression

## Description

The string which contains Search (Haystack).

## Data type

String

## Parameter: Search

## Description

The string which shall be replaced (Needle).

## Data type

String

## Parameter: Replacement

## Description

The string which shall be used as replacement for Search.

Data type
String

## Example

```
1 $
2 a[1] = String.Replace("Milk products are
3 from cows",
    "Milk", "Meat")
```

a[1] whould be at end: "Meat products are from cows"

## ToUpper

## Description

Translates each letter (a to z ) of a String into upper case letters.

## Syntax

## 1 String. ToUpper(String)

## Return value

String

## Type

Method

## Parameter: String

## Description

The string whose lower case letters shall be translated into upper case letters.

## Data type

String

## Example

$$
\begin{aligned}
& 1 \text { \$ } \\
& 2 \mathrm{a}[1]=\text { String.ToUpper("UPPER and lower case } \\
& \text { LETTERS") }
\end{aligned}
$$

a[1] whould be at end: "UPPER AND LOWER CASE LETTERS"
$\qquad$

## ToLower

## Description

Translates each letter (a to z ) of a string into lower case letters.

## Syntax

## 1 String.ToLower(String)

## Return value

String

## Type

Method

## Parameter: String

## Description

The string whose upper case letters shall be translated into lower case letters.

## Data type

String

## Example

$$
\begin{aligned}
& 1 \text { \$ } \\
& 2 \mathrm{a}[1]=\text { String.ToLower("UPPER and lower case } \\
& \text { LETTERS") }
\end{aligned}
$$

a[1] whould be at end: "upper and lower case letters"
$\qquad$

## Reverse

## Description

Reverses the content of a string.

## Syntax

## 1 String.Reverse(String)

## Return value

String

## Type

Method

## Parameter: String

## Description

The string whose content shall be reversed.

## Data type

String

## Example

$$
\begin{aligned}
& 1 \text { \$ } \\
& 2 \mathrm{a}[1]=\text { String.Reverse("Reversed") }
\end{aligned}
$$

a[1] whould be at end: "desreveR"

## Fill

## Description

Concatenates a string multiple times.

## Syntax

## 1 String.Fill(String, Count)

## Return value

String
Type
Method

## Parameter: String

## Description

The string which shall be repeated.

Data type

String

## Parameter: Count

Description

The number of repeats.

## Data type

Dword

## Range

0 to 10000

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { "We are" + String.Fill(" hungry", 3) }
\end{aligned}
$$

a [1] whould be at end: "We are hungry hungry hungry"

## Format

## Description

Formats a number similar to the MessageLink. The first char must be a F (for double) or a D (for dword). Accordingly the second parameter will be formatted either as dword or double. If it is formatted as dword then the minimum length of digits can follow the D (e. g. D 4 whould be a dword with at least 4 digits). If the number is formatted as double then you can specify the minimum integer length and/or the exact decimal length (e. g. F2.3 for at least 2 integer digits an exact 3 decimal digits).

## Syntax

## 1 String. Format(Format, Number)

## Return value

String

## Type

Method

## Parameter: Format

## Description

The format string for the number.

Data type

String

## Parameter: Number

## Description

The number which shall be formatted.

## Data type

Dword or double

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { String.Format("f0.4", 123.7) }
\end{aligned}
$$

a[1] whould be at end: "123.7000" (if Convert.DecimalComma whould be 1 then a comma whould have been used instead of a point as decimal separator)

## WeekdayName

## Description

Returns the name of a weekday. This method depends on the chosen language of Destiny.dll.

## Syntax

## 1 String.WeekdayName(Number, Short)

## Return value

String

## Type

Method, depends on language

## Parameter: Number

## Description

The number of the weekday. ( $0=$ Sunday, 1 = Monday, 2 = Tuesday, 3 = Wednesday, 4 = Thursday, 5 = Friday, $6=$ Saturday)

## Data type

Byte

## Range

0 to 6

## Parameter: Short

## Description

Specifies either the weekday shall return in short format (e. g. Sat) or long format (e. g. Saturday). True means short format.

## Data type

Switch

## Example

$$
\begin{aligned}
& 1 \text { \$ } \\
& 2 \mathrm{a}[1]=\text { String.WeekdayName(3, True) }
\end{aligned}
$$

a[1] whould be at end: "Wed" (if Destiny.Language whould be 0 then the return value whould be "Mi")

## MonthName

## Description

Returns the name of a month. This method depends on the chosen language of Destiny.dll.

## Syntax

## 1 String. MonthName(Number, Short)

## Return value

String

## Type

Method, depends on language

## Parameter: Number

## Description

The number of the month. (1 = January, 2 = February, 3 = March, $4=$ April, 5 = May, 6 = June, 7 = July, 8 = August, $9=$ September, 10 = October, 11 = November, 12 = December)

## Data type

Byte

## Range

1 to 12

## Parameter: Short

## Description

Specifies either the month shall return in short format (e. g. Jan) or long format (e. g. January). True means short format.

## Data type

Switch

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { String.MonthName(12, False) }
\end{aligned}
$$

a[1] whould be at end: "December" (if Destiny.Language whould be 1 then the return value whould be "Dezember")

[^4]
### 9.7 Error object

## Description

You can enable/disable single error messages and/or query captions with the Error object. This object requires an index to specify which error message shall be responded. You can use the Error constants for this index (e. g. Error[ERROR_SYNTAX].Enabled). A description of the errors can be found at the error messages.

## List of methods/properties

| Name | Type | Short description |
| :--- | :--- | :--- |
| Enabled | Property | Specifies wether an error message is enabled |
| Title | Property | The title of an error message |
| Message | Property | The content of an error message |

## Enabled

## Description

If this switch is activated then the error message will be displayed if necessary. If all error messages have been disabled using the Errors object this switch is ineffective.

## Syntax

## 1 Error[Index]. Enabled

## Data type

Switch

## Type

Property

## Example

| 1 \$ |
| :--- |
| 2 Error[ERROR_READONLY].Enabled = False |

At the end the error message for the write access on read-only values whould be disabled.

## Title

## Description

This property returns the title of an error message used in the title of the error message window. This value depends on the chosen language of the Destiny.dll.

## Syntax

## 1 Error[Index].Title

## Data type

String

## Type

Property, read-only, depends on language

## Example

| $1 \$$ |
| :--- |
| $2 \mathrm{a}[1]=$ Error[ERROR_SYNTAX].Title |

a[1] whould be at the end: "Error 1: Syntax" (if Destiny.Language whould be 0 then a[1] whould be a german title)

## Message

## Description

This property returns the message used in the body of the error message window. This value depends on the chosen language of the Destiny.dll.

## Syntax

$$
1 \text { Error[Index]. Message }
$$

## Data type

String

## Type

Property, read-only, depends on language

## Example

$$
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { Error[ERROR_SYNTAX].Message }
\end{aligned}
$$

a[1] whould be at the end: "The syntax is invalid!" (if Destiny.Language whould be 0 then a[1] whould be a german message)

```
< Back
9.7 Error object
Forward >
9.6 String object

\subsection*{9.8 Errors object}

\section*{Description}

You can enable/disable all error messages with the Error object.
Additionally you control the error handling.

\section*{List of methods/properties}
\begin{tabular}{||c|c|l|}
\hline Name & Type & \multicolumn{1}{c|}{ Short description } \\
\hline \hline Enable & Method & Enables the error message output system \\
\hline \hline Disable & Method & Disables the error message output system \\
\hline Resume & Method & Admits multi-line DestinyScripts to continue on errors \\
\hline Halt & Method & Admits multi-line DestinyScript to abort on errors \\
\hline \hline Catch & Method & Returns the number of the last occured error \\
\hline \hline
\end{tabular}

\section*{Enable}

\section*{Description}

Enables the error message output system. This has no effect on the single disabled errors via the Error object (this means if an error occurs and it has been disabled with the Error object then there won't be any error message shown).

\section*{Syntax}

1Errors.Enable()

\section*{Return value}

None
Type
Method

\section*{Example}
```

1 \$
2 Errors.Enable()

```

At the end error messages whould be shown if necessary (= default option).

\section*{Disable}

\section*{Description}

Disables the error message output system. All error messages will be suppressed. This happens even if single errors have been enabled using the Error object.

\section*{Syntax}

\section*{1 Errors.Disable()}

\section*{Return value}

None

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \text { \$ \$ } \\
& 2 \text { Errors. Disable( ) } \\
& \hline
\end{aligned}
\]

At the end no error messages whould be shown.

\section*{Resume}

\section*{Description}

If you call this method then multi-line DestinyScripts will continue running if an error occurs.

\section*{Syntax}

\section*{1 Errors.Resume()}

\section*{Return value}

None

\section*{Type}

Method

\section*{Example}
```

1 \$
2v[1] = 0;
3 Errors.Resume();
4v[2] = 5 / 0;
5v[1] = 5

```
v[1] whould be at end: 5 (the line 4 raises a "Division by zero" error. The following lines will still be executed!)

\section*{Halt}

\section*{Description}

If you call this method then multi-line DestinyScripts will abort if an error occurs (= default option).

\section*{Syntax}

\section*{1 Errors.Halt()}

\section*{Return value}

None

\section*{Type}

Method

\section*{Example}
```

1 \$
2v[1] = 0;
3 Errors.Halt();
4v[2] = 5 / 0;
5v[1] = 5

```
\(\mathrm{v}[1]\) whould be at end: 0 (the line 4 raises a "Division by zero" error. So the following lines won't be executed!)

\section*{Catch}

\section*{Description}

This method returns the number of the last occured error. If no error has occured the return value is 0 . After a query of this method the number of the last occured error will be reset to 0 . If an unknown error occured the return value is -1 (this differs from ERROR_UNKNOWN which has the value 0 ).

\section*{Syntax}

\section*{1 Errors.Catch()}

\section*{Return value}

Dword

\section*{Type}

Method

\section*{Example}

In this example two DestinyScripts will run serially, but in two different RPG-Maker comments.
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[2] /=0 \\
& \hline \hline 1 \$ \\
& 2 \mathrm{v}[1]=\operatorname{Errors} . \operatorname{Catch}()
\end{aligned}
\]
v [1] whould be at end: 15 (this is the error number of the "Division by zero" number)
< Back
9.7 Error object

\subsection*{9.9 Keyboard object}

\section*{Description}

You can query/set key states with the Keyboard object. The mouse buttons (left, middle, right) will be queried with this object, too. (You can use the mouse button constants for this)

\section*{List of methods/properties}
\begin{tabular}{|c|c|l||}
\hline Name & Type & \multicolumn{1}{|c|}{ Short description } \\
\hline GetKeyState & Method & Queries the state of a key \\
\hline GetKey & Method & Returns the key code of the last pressed key \\
\hline \hline GetKeyText & Method & \begin{tabular}{l} 
Returns the key code of the last pressed key \\
considering to the char repeat
\end{tabular} \\
\hline \hline SetKeyState & Method & Sets the state of a key \\
\hline \hline
\end{tabular}

\section*{GetKeyState}

\section*{Description}

With this method you can query the current key state of a specified key. You can use the virtual key code constants for this. This method returns a value unequal to zero if the key is pressed. This method is equivalent to the Windows function GetAsyncKeyState.

\section*{Syntax}
\[
1 \text { Keyboard.GetKeyState(Keycode) }
\]

\section*{Return value}

Word
Type
Method

\section*{Parameter: Keycode}

\section*{Description}

The number of the key to be queried. You can use the virutal key code constants for this.

\section*{Datentyp}

Dword

\section*{Example}
\(\square\)
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Keyboard.GetKeyState(VK_DOWN) } \\
& \hline
\end{aligned}
\]

If the key [Arrow down] is pressed then v[1] whould be at end -32767 or -32768, otherwise 0 or 1 .

\section*{GetKey}

\section*{Description}

Queries all keys from 1 to 254 and returns the first number of the pressed key. If no key is pressed this method will return 0 .

\section*{Syntax}

1 Keyboard.GetKey()

\section*{Return value}

Dword

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \vee[1]=\text { Keyboard.GetKey() }
\end{aligned}
\]

At the end the virtual key code of the last pressed key whould be returned. But only the first found key will be returned. If more than one key is pressed at the same time then only the lower virtual key code will be returned. Hence you should use the GetKeyText method for text input.

\section*{GetKeyText}

\section*{Description}

Queries all keys from 1 to 254 and returns the first number of the pressed key considering to the char repeat. If no key is pressed with expedient char repeat this method will return 0 . This method can be used for text input.

\section*{Syntax}

\section*{1 Keyboard. GetKeyText()}

\section*{Return value}

Dword

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Keyboard.GetKeyText( ) }
\end{aligned}
\]

At the end the last pressed key (considering to the char repeat) whould be returned. If you use this in a loop then you could input chars in the correct order. If a char whould be hold down then the char repeat whould make sure that not each loop will return this key code.

\section*{SetKeyState}

\section*{Description}

You can set the state of a key with this method. You can use the virtual key code constants for this. To specify the key state you can use the key state constants. This method is equivalent to the windows function keybd_event.

\section*{Syntax}

\section*{1 Keyboard.SetKeyState(Keycode, Keystate)}

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: Keycode}

\section*{Description}

The virtual key code. You can use the virtual key code constants for this.

\section*{Datentyp}

Dword

\section*{Parameter: Keystate}

\section*{Description}

The new key state. You can use the key state constants for this.

\section*{Datentyp}

Dword

\section*{Example}

> \begin{tabular}{l} \hline 1 \$ \\ 2 Keyboard.SetKeyState(VK_RIGHT, \\ KEYEVENTF_KEYDOWN) \\ \hline \end{tabular}

At the end the player whould try to move right, because the computer thinks the right arrow key is pressed. This will stop if the right arrow key is released (in this case you must even press it first!). To "release" the key via DestinyScript you can use the KEYEVENTF_KEYUP constant instead of KEYEVENTF_KEYDOWN.

\footnotetext{
< Back
9.8 Errors object
9.9 Keyboard object

Forward >
9.10 Mouse object
}

\subsection*{9.10 Mouse object}

\section*{Description}

You can get/set the position of the mouse cursor via the Mouse object. The cursor position is relative to the upper left corner of the game window. If the game is in window mode the coordinates will be transformed automatically.

\section*{List of methods/properties}
\begin{tabular}{||c|c|l|}
\hline Name & Type & \multicolumn{1}{c|}{ Short description } \\
\hline X & Property & The current x coordinate of the mouse cursor \\
\hline Y & Property & The current y coordinate of the mouse cursor \\
\hline \hline
\end{tabular}

\section*{\(X\)}

\section*{Description}

This property represents the x coordinate of the mouse cursor and is relative to the upper left corner of the game window. If the game window is stretched then the x coordinate will be transformed automatically. The unit for this value is pixel.

\section*{Syntax}
\[
1 \text { Mouse. X }
\]

\section*{Data type}

Dword

\section*{Type}

\section*{Property}

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \text { Mouse } \cdot X=10
\end{aligned}
\]

At the end the x coordinate of the mouse cursor whould be 10 pixel away from the left border of the game window.

\section*{\(Y\)}

\section*{Description}

This property represents the y coordinate of the mouse cursor and is relative to the upper left corner of the game window. If the game window is stretched then the y coordinate will be transformet automatically. The unit for this value is pixel.

\section*{Syntax}
\[
1 \text { Mouse. Y }
\]

\section*{Data type}

Dword

\section*{Type}

\section*{Property}

\section*{Example}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Mouse. } \mathrm{Y}
\end{aligned}
\]

At the end v[1] whould be the current y coordinate relative to the upper border of the game window.
9.10 Mouse object

\subsection*{9.11 Time object}

\section*{Description}

You can query the current date/time of the computer with the Time object.

\section*{List of methods/properties}
\begin{tabular}{|l|l|l|}
\hline \multicolumn{1}{|c|}{ Name } & Type & \multicolumn{1}{c|}{ Short description } \\
\hline Weekday & Property & The current weekday \\
\hline Day & Property & The current day of the month \\
\hline Month & Property & The current month \\
\hline \hline Year & Property & The current year \\
\hline Hour & Property & The current hour \\
\hline Minute & Property & The current minute \\
\hline Second & Property & The current second \\
\hline Millisecond & Property & The current millisecond \\
\hline Tick & Property & A continuous counter in milliseconds \\
\hline \hline
\end{tabular}

\section*{Weekday}

\section*{Description}

This property returns the current weekday. Sunday is the first day of the week ( 0 = Sunday, 1 = Monday, 2 = Tuesday, 3 = Wednesday, 4 = Thursday, 5 = Friday, 6 = Saturday).

\section*{Syntax}

\section*{1 Time. Weekday}

\section*{Data type}

Word

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Time.Weekday } \\
& \hline
\end{aligned}
\]

At the end v[1] whould be the current weekday (e. g. on a tuesday v[1] whould be 2).

\section*{Day}

\section*{Description}

This property returns the current day of the month.

\section*{Syntax}

\section*{1 Time. Day}

\section*{Data type}

Word

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Time.Day }
\end{aligned}
\]

At the end v[1] whould be the current day of the month (e. g. at the 08. January 1987 this whould be 8).

\section*{Month}

\section*{Description}

This property returns the current month. (1 = January, 2 = February, 3 = March, 4 = April, 5 = May, 6 = June, 7 = July, 8 = August, 9 = September, 10 = October, 11 = November, 12 = December)

\section*{Syntax}

\section*{1 Time. Month}

\section*{Data type}

Word

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Time.Month } \\
& \hline
\end{aligned}
\]

At the end v[1] whould be the current month (e. g. at the 08. January 1987 this whould be 1).

\section*{Year}

\section*{Description}

This property returns the current year.

\section*{Syntax}

\section*{1 Time. Year}

\section*{Data type}

Word

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Time. Year }
\end{aligned}
\]

At the end v[1] whould be the current year (e. g. at the 08. January 1987 this whould be 1987).

\section*{Hour}

\section*{Description}

This property returns the current hour.

\section*{Syntax}

\section*{1 Time. Hour}

\section*{Data type}

Word
Type
Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Time.Hour }
\end{aligned}
\]

At the end v[1] whould be the current hour (e. g. at 12:30 this whould be 12).

\section*{Minute}

\section*{Description}

This property returns the current minute.

\section*{Syntax}

\section*{1 Time. Minute}

\section*{Data type}

Word

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Time.Minute }
\end{aligned}
\]

At the end v[1] whould be the current minute (e. g. at 12:30 this whould be 30).

\section*{Second}

\section*{Description}

This property returns the current second.

\section*{Syntax}

\section*{1 Time. Second}

\section*{Data type}

Word
Type
Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Time.Second }
\end{aligned}
\]

At the end \(\mathrm{v}[1]\) whould be the current second.

\section*{Millisecond}

\section*{Description}

This property returns the current millisecond.

\section*{Syntax}

\section*{1 Time. Millisecond}

\section*{Data type}

Word

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Time.Millisecond }
\end{aligned}
\]

At the end v[1] whould be the current millisecond.

\section*{Tick}

\section*{Description}

This counter counts every millisecond up by one. The value of this property is equivalent to the Windows function GetTickCount. This property can be used to measure time differences. You simply save the value before and after an action. The difference is the required time for that action in milliseconds.

\section*{Syntax}

\section*{1 Time.Tick}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Time.Tick }
\end{aligned}
\]

At the end \(\mathrm{v}[1]\) whould be the current tick of the computer.

\subsection*{9.12 Actor object}

\section*{Description}

You can get/set the properties of an hero with the Actor object. This object requires an index to specify which hero shall be responded. This index is the same as the hero id in the RPG-Maker 2000 database.

\section*{List of methods/properties}
\begin{tabular}{||l|l|l|}
\hline \multicolumn{1}{|c|}{ Name } & \multicolumn{1}{c|}{ Type } & \multicolumn{1}{c|}{ Short description } \\
\hline Name & Property & The name of the hero \\
\hline Degree & Property & The degree of the hero \\
\hline Level & Property & The level of the hero \\
\hline HP & Property & The health points of the hero \\
\hline MP & Property & The magic points of the hero \\
\hline \hline AttackDiff & Property & The difference of the hero's attack points \\
\hline DefenseDiff & Property & The difference of the hero's defense points \\
\hline MindDiff & Property & The difference of the hero's mind points \\
\hline \hline AgilityDiff & Property & The difference of the hero's agility points \\
\hline MaxHPDiff & Property & The difference of the hero's maximum health points \\
\hline MaxMPDiff & Property & The difference of the hero's maximum magic points \\
\hline EXP & Property & The expansion points of the hero \\
\hline \hline
\end{tabular}

\section*{Name}

\section*{Description}

This is the current name of the hero.

\section*{Syntax}

\section*{1 Actor[Index]. Name}

\section*{Data type}

String

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { Actor[1]. Name }
\end{aligned}
\]

At the end a[1] whould contain the name of the first hero (in this case probably "Alex").

\section*{Degree}

\section*{Description}

This is the current degree of the hero.

\section*{Syntax}

\section*{1 Actor[Index]. Degree}

\section*{Data type}

String

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { Actor[1].Degree }
\end{aligned}
\]

At the end a[1] whould contain the degree of the first hero (in this case probably "Soldier").

\section*{Level}

\section*{Description}

This is the current level of the hero. If you change this property then the expansion points won't be changed automatically, too.

\section*{Syntax}

\section*{1 Actor[Index]. Level}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
```

1 \$
2v[1] = Actor[1].Level

```

At the end v[1] whould contain the current level of the first hero (in this case probably 1).

\section*{HP}

\section*{Description}

This the current health point value of the hero.

\section*{Syntax}

\section*{1 Actor[Index].HP}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Actor[1]. } \mathrm{HP}
\end{aligned}
\]

At the end v[1] whould contain the health points of the first hero (in this case probably 48).

\section*{MP}

\section*{Description}

This is the current magic point value of the hero.

\section*{Syntax}

\section*{1 Actor[Index].MP}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Actor[1]. MP }
\end{aligned}
\]

At the end \(\mathrm{v}[1]\) whould be the current magic points of the first hero (in this case probably 38).

\section*{AttackDiff}

\section*{Description}

This is the difference between the current attack points to the normal attack points of the hero's level. (e. g. if the hero whould usually have 10 attack points on the current level, but totally has 12 attack points, then the difference whould be 2)

\section*{Syntax}

\section*{1 Actor[Index].AttackDiff}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Actor[1].AttackDiff }
\end{aligned}
\]

\section*{DefenseDiff}

\section*{Description}

This is the difference between the current defense points to the normal defense points of the hero's level. (For a difference example see AttackDiff)

\section*{Syntax}

\section*{1 Actor[Index]. DefenseDiff}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Actor[1].DefenseDiff }
\end{aligned}
\]

\section*{MindDiff}

\section*{Description}

This is the difference between the current mind points to the normal mind points of the hero's level. (For a difference example see AttackDiff)

\section*{Syntax}

\section*{1 Actor[Index].MindDiff}

\section*{Data type}

Dword
Type
Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \vee[1]=\text { Actor[1].MindDiff }
\end{aligned}
\]

\section*{AgilityDiff}

\section*{Description}

This is the difference between the current agility points to the normal agility points of the hero's level. (For a difference example see AttackDiff)

\section*{Syntax}

\section*{1 Actor[Index].AgilityDiff}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Actor[1].AgilityDiff }
\end{aligned}
\]

\section*{MaxHPDiff}

\section*{Description}

This is the difference between the current maximum health points to the normal maximum health points of the hero's level. (For a difference example see AttackDiff)

\section*{Syntax}

\section*{1 Actor[Index].MaxHPDiff}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Actor[1].MaxHPDiff }
\end{aligned}
\]

\section*{MaxMPDiff}

\section*{Description}

This is the difference between the current maximum magic points to the normal maximum health points of the hero's level. (For a difference example see AttackDiff)

\section*{Syntax}

\section*{1 Actor[Index].MaxMPDiff}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Actor[1].MaxMPDiff }
\end{aligned}
\]

\section*{EXP}

\section*{Description}

This is the expansion point value of the hero. If you change this value the level of the hero will not be changed automatically, too.

\section*{Syntax}

\section*{1 Actor[Index].EXP}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\begin{tabular}{|c|c|c|}
\hline \multicolumn{3}{|l|}{\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Actor[1].EXP }
\end{aligned}
\]} \\
\hline < Back & & Forward> \\
\hline 9.11 Time object & 9.12 Actor object & 9.13 Map object \\
\hline
\end{tabular}

\subsection*{9.13 Map object}

\section*{Description}

You can get/set the properties of the current map with the Map object. You can read generic informations (width, height, ...) or change the single chips (upper chip, lower chip).

\section*{List of methods/properties}
\begin{tabular}{||l|l|l||}
\hline \multicolumn{1}{|c|}{ Name } & Type & \multicolumn{1}{c|}{ Short description } \\
\hline ID & Property & The id of the map \\
\hline Width & Property & The width of the map \\
\hline Height & Property & The height of the map \\
\hline HeroX & Property & The x coordinate of the hero on the map \\
\hline HeroY & Property & The y coordinate of the hero on the map \\
\hline Chipset & Property & The id of the map's used chipset \\
\hline Lower & Property & The lower chip at a specific position on the map \\
\hline Upper & Property & The upper chip at a specific position on the map \\
\hline \hline EventCount & Property & The number of events on the map \\
\hline \hline
\end{tabular}

\section*{ID}

\section*{Description}

This is the id used by the RPG-Maker 2000 to identify the current map.

\section*{Syntax}

\section*{1 Map. ID}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\operatorname{Map} . I D
\end{aligned}
\]

At the end v[1] whould contain the Id of the current map (in this case probably 1).

\section*{Width}

\section*{Description}

This is the width (in chips) of the current map.

\section*{Syntax}

\section*{1 Map.Width}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Map.Width }
\end{aligned}
\]

At the end v[1] whould contain the width of the current map (e. g. on a 20 x 15 sized map this whould be 20 ).

\section*{Height}

\section*{Description}

This is the height (in chips) of the current map.

\section*{Syntax}

\section*{1 Map. Height}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \vee[1]=\text { Map.Height }
\end{aligned}
\]

At the end v[1] whould contain the height of the current map (e. g. on a 20 x 15 sized map this whould be 15).

\section*{HeroX}

\section*{Description}

This is the current hero's x coordinate on the current map.
Syntax

\section*{1 Map. HeroX}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Map.HeroX }
\end{aligned}
\]

At the end \(\mathrm{v}[1]\) whould contain the current x coordinate of the hero.

\section*{HeroY}

\section*{Description}

This is the current hero's y coordinate on the current map.

\section*{Syntax}

\section*{1 Map. HeroY}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Map.HeroY }
\end{aligned}
\]

At the end \(\mathrm{v}[1]\) whould contain the current y coordinate of the hero.

\section*{Chipset}

\section*{Description}

This is the id of the chipset which is used by the current map.

\section*{Syntax}

\section*{1 Map. Chipset}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Map.Chipset }
\end{aligned}
\]

At the end \(\mathrm{v}[1]\) whould contain the chipset id of the current map.

\section*{Lower}

\section*{Description}

This is the lower chip at a specific position on the map. A two dimensional index is used to specify the position. The first value is the \(x\) coordinate an the second value is the y coordinate. Both values start at 0 . The boundaries of the map may not be exceeded.

\section*{Syntax}
\[
1 \text { Map . Lower }[\mathrm{X}, \mathrm{Y}]
\]

\section*{Data type}

Word

\section*{Type}

\section*{Property}

\section*{Example}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { Map. Lower }[0,0]=4333 \\
& \hline
\end{aligned}
\]

At the end the lower chip in the upper left corner of the map (position 0,0 ) whould be changed to a poisoned chip (depends on the chipset).

\section*{Upper}

\section*{Description}

This is the upper chip at a specific position on the map. A two dimensional index is used to specify the position. The first value is the \(x\) coordinate an the second value is the y coordinate. Both values start at 0 . The boundaries of the map may not be exceeded.

\section*{Syntax}
\[
1 \text { Map. Upper }[\mathrm{X}, \mathrm{Y}]
\]

\section*{Data type}

Word

\section*{Type}

\section*{Property}

\section*{Example}
```

1 \$
2 Map.Upper[Map.Width - 1, 0] = 10000

```

At the end the upper chip in the upper right corner of the map whould be a clear chip (depends on the chipset).

\section*{EventCount}

\section*{Description}

This is the total number of events (excluding the hero and the vehicles) on the map. This property can be quite well combined for loops with the MapEvent object.

\section*{Syntax}

\section*{1 Map. EventCount}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Map.EventCount }
\end{aligned}
\]

At the end \(\mathrm{v}[1]\) whould contain the number of events on the current map.
9.13 Map object

Forward >

\subsection*{9.14 Event object}

\section*{Description}

You can get/set the properties of an event with the Event object. The Event object requires an index to specify which event shall be responded. This index is the event id used in the RPG-Maker. Because the event id is not continuous numbered this object is not capable for loops. If you want to access events in loops then you should use the MapEvent object. If you want to access a special event (this, hero, boat, ship or airship) you can use the special event constants as index.

\section*{List of methods/properties}
\begin{tabular}{||l|l|l||}
\hline \multicolumn{1}{|c|}{ Name } & \multicolumn{1}{c|}{ Type } & \multicolumn{1}{c|}{ Short description } \\
\hline ID & Property & The id of the event \\
\hline MapID & Property & The id of the map where the event is placed \\
\hline X & Property & The x coordinate of the event \\
\hline Y & Property & The y coordinate of the event \\
\hline Dir1 & Property & The first part of the event's direction \\
\hline \hline Dir2 & Property & The second part of the event's direction \\
\hline DirFlags & Property & The direction properties of the event \\
\hline Exists & Property & The clear state of the event \\
\hline ScreenX & Property & The x coordinate of the event on the screen \\
\hline ScreenY & Property & The y coordinate of the event on the screen \\
\hline Frame & Property & The current frame of the event \\
\hline Offset & Property & The current offset to the next field of the event \\
\hline Charset & Property & The name of the event's charset \\
\hline Frequency & Property & The movement frequency of the event \\
\hline Speed & Property & The movement speed of the event \\
\hline Transparency & Property & The transparency of the event \\
\hline FixDir & Property & The fixed direction property of the event \\
\hline Phasing & Property & The "walk trough walls" property of the event \\
\hline StopAnimation & Property & The "no walk animation" property of the event \\
\hline JumpTime & Property & The jump time value of the event \\
\hline \hline
\end{tabular}

\section*{ID}

\section*{Description}

This is the id used to identify the event in the RPG-Maker.

\section*{Syntax}

\section*{1 Event[Index].ID}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Event[1].ID }
\end{aligned}
\]

At the end \(\mathrm{v}[1]\) whould contain the id of the first event (in this case 1).

\section*{MapID}

\section*{Description}

This is the id of the map where the event is currently placed.

\section*{Syntax}

\section*{1 Event[Index].MapID}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Event[1]. MapID }
\end{aligned}
\]

At the end \(\mathrm{v}[1]\) whould be the first event's map id (in this case probably 1 ).

\section*{\(x\)}

\section*{Description}

This is the x coordinate (in chips) of the event on the current map.

\section*{Syntax}

\section*{1 Event[Index]. X}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Event[1]. } \mathrm{X}
\end{aligned}
\]

\section*{\(Y\)}

\section*{Description}

This is the y coordinate (in chips) of the event on the current map.

\section*{Syntax}

\section*{1 Event[Index]. Y}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Event [1]. Y } \\
& \hline
\end{aligned}
\]

\section*{Dir1}

\section*{Description}

This is the first part of the direction flags of the event.

\section*{Syntax}

\section*{1 Event[Index].Dir1}

\section*{Data type}

Byte

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Event[1].Dir1 }
\end{aligned}
\]

\section*{Dir2}

\section*{Description}

This is the second part of the direction flags of the event.

\section*{Syntax}

\section*{1 Event[Index]. Dir2}

\section*{Data type}

Byte

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { Event[HERO].Dir2 = DIR_RIGHT }
\end{aligned}
\]

\section*{DirFlags}

\section*{Description}

This is the direction property of the event (this is a combination of Dir1 and Dir2).

\section*{Syntax}
\[
1 \text { Event[Index].DirFlags }
\]

\section*{Data type}

Word
Type
Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Event[1].DirFlags }
\end{aligned}
\]

\section*{Exists}

\section*{Description}

This property is true whether the event does "exist". If this value is false then the event has been cleared (e. g. with the "clear timer" from the RPGMaker).

\section*{Syntax}

\section*{1 Event[Index]. Exists}

\section*{Data type}

Switch

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { Event[1].Exists = False }
\end{aligned}
\]

At the end the first event whould be cleared.

\section*{ScreenX}

\section*{Description}

This is the x coordinate of the event in pixel.

\section*{Syntax}

\section*{1 Event[Index].ScreenX}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Event[1].ScreenX }
\end{aligned}
\]

\section*{ScreenY}

\section*{Description}

This is the y coordinate of the event in pixel.

\section*{Syntax}

\section*{1 Event[Index].ScreenY}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Event[1].ScreenY }
\end{aligned}
\]

Frame

\section*{Description}

This is the current frame (a piece of the charset) of the event.
Syntax

\section*{1 Event[Index].Frame}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Event[1]. Frame }
\end{aligned}
\]

\section*{Offset}

\section*{Description}

This is the offset from the next field of the event in considering to its direction.

\section*{Syntax}

\section*{1 Event[Index].Offset}

\section*{Data type}

Dword
Type
Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Event[1].Offset }
\end{aligned}
\]

\section*{Charset}

\section*{Description}

This is the name of the event's currently used charset.

\section*{Syntax}

\section*{1 Event[Index]. Charset}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { Event[1].Charset }
\end{aligned}
\]

At the end a[1] whould contain the used charset of the first event (e. g. "CROWN7" for the RTP file "CROWN7.png").

\section*{Frequency}

\section*{Description}

This is the current movement frequency of the event. This value should be in the range of 1 to 8 .

\section*{Syntax}

\section*{1 Event[Index]. Frequency}

\section*{Data type}

Dword
Type
Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Event[1].Frequency }
\end{aligned}
\]

\section*{Speed}

\section*{Description}

This is the current movement speed of the event. This value should be in the range of 1 to 8 .

\section*{Syntax}

\section*{1 Event[Index]. Speed}

\section*{Data type}

Dword
Type
Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Event[1].Speed }
\end{aligned}
\]

\section*{Transparency}

\section*{Description}

This is the current transparency of the event. This value should be in the range of 0 to 8 .

\section*{Syntax}

\section*{1 Event[Index].Transparency}

\section*{Data type}

Dword
Type
Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Event[1].Transparency }
\end{aligned}
\]

\section*{FixDir}

\section*{Description}

This property decides whether the direction of the event is fixed (true means the direction is fixed)

\section*{Syntax}

\section*{1 Event[Index]. FixDir}

\section*{Data type}

Switch
Type
Property

\section*{Example}
```

1 \$
2 Event[THIS].FixDir = True

```

At the end the direction of the current event whould be fixed.

\section*{Phasing}

\section*{Description}

This property decides whether an event can walk trough walls, etc. (true means the event can walk through walls).

\section*{Syntax}

\section*{1 Event[Index].Phasing}

\section*{Data type}

Switch

\section*{Type}

Property

\section*{Example}

\section*{1 \$ \\ 2 Event[THIS].Phasing = True}

At the end the current event could walk trough walls.

\section*{StopAnimation}

\section*{Description}

This property decides whether an event has a movement animation. (true means the event has no walking animation).

\section*{Syntax}

1 Event[Index].StopAnimation

\section*{Data type}

Switch

\section*{Type}

Property

\section*{Example}
```

1 \$
2 Event[THIS].StopAnimation = True

```

At the end the current event whouldn't have a walking animation.

\section*{JumpTime}

\section*{Description}

This property contains the jump time of the event.

\section*{Syntax}

\section*{1 Event[Index].JumpTime}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Event[1].JumpTime }
\end{aligned}
\]

\subsection*{9.15 MapEvent object}

\section*{Description}

You can get/set properties of an event with the MapEvent object. The MapEvent object requires an index which is the number of the event started by zero (e. g. 0 is the first event on the map, 1 is the second, ...). This index is not the same as the event id used in the RPG-Maker to identfy events. If you want to access a single event using its id you should use the Event object. If you want to access a special event (this, hero, boat, ship or airship) you can use the special event constants as index.

\section*{List of methods/properties}

Given that this object is completely identical to the Event object (except of the different index) see for a list of methods/properties there.
< Back9.14 Event object

\subsection*{9.16 Picture object}

\section*{Description}

You can get/set the properties of a picture with the Picture object.
Additionally you can edit its content. The Picture object requires an index to specify which picture is responded. This index is the picture id.

\section*{List of methods/properties}
\begin{tabular}{||l|l|l|}
\hline \multicolumn{1}{|c|}{ Name } & \multicolumn{1}{c|}{ Type } & \multicolumn{1}{c|}{ Short description } \\
\hline X & Property & The x coordinate of the picture \\
\hline Y & Property & The y coordinate of the picture \\
\hline Width & Property & The width of the picture \\
\hline Height & Property & The height of the picture \\
\hline Magnification & Property & The magnification of the picture \\
\hline Transparency & Property & The transparency of the picture \\
\hline \hline Red & Property & The red coloration of the picture \\
\hline Green & Property & The green coloration of the picture \\
\hline Blue & Property & The blue coloration of the picture \\
\hline Chroma & Property & The chroma of the picture \\
\hline Action & Property & The action of the picture \\
\hline ActionStrength & Property & The action strength of the picture \\
\hline ActionValue & Property & The current action value of the picture \\
\hline MapMove & Property & The move with map property of the picture \\
\hline \hline MapX & Property & The relative x coordinate of the picture on the \\
\hline map \\
\hline MapY & Property & The relative y coordinate of the picture on the \\
\hline map \\
\hline Pixel & Property & A pixel of the picture at a specific position \\
\hline \hline Palette & Property & A specified palette entry \\
\hline UseMaskColor & Property & The "use mask color" property of the picture \\
\hline DrawLine & Method & Draws a line into the picture \\
\hline FillRect & Method & Draws a filles rectangular into the picture \\
\hline CopyRect & Method & \begin{tabular}{l} 
Copies a rectangular from one picture into an \\
other
\end{tabular} \\
\hline BltRect & Method & Copies a rectangular from on picture into an \\
\hline & & \\
\hline
\end{tabular}
\begin{tabular}{||l||l|l||} 
& & Other an skips a specific color \\
\hline \hline FlushPalette & Method & Applies changes of the palette \\
\hline \hline
\end{tabular}

\section*{\(X\)}

\section*{Description}

This is the current x coordinate of the picture (in pixel). The RPG-Maker 2000 relates this coordinate to the center of the picture. If this value is too huge then the RPG_RT could crash. A more specific description can be found at the known bugs.

\section*{Syntax}

\section*{1 Picture[Index].X}

\section*{Data type}

Double

\section*{Type}

\section*{Property}

\section*{Example}
```

1 \$
2f[1] = Picture[1].X

```

At the end \(f[1]\) whould contain the \(x\) coordinate of the first picture (e. g. at the position 160:120 this whould be 160).

\section*{\(Y\)}

\section*{Description}

This is the current y coordinate of the picture (in pixel). The RPG-Maker 2000 relates this coordinate to the center of the picture. If this value is too huge then the RPG_RT could crash. A more specific description can be found at the known bugs.

\section*{Syntax}

\section*{1 Picture[Index].Y}

\section*{Data type}

Double

\section*{Type}

\section*{Property}

\section*{Example}
```

1 \$
2f[1] = Picture[1].Y

```

At the end \(\mathrm{f}[1]\) whould contain the \(y\) coordinate of the first picture (e. g. at the position 160:120 this whould be 120).

\section*{Width}

\section*{Description}

This is the width of the picture.

\section*{Syntax}

\section*{1 Picture[Index].Width}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Picture[1].Width }
\end{aligned}
\]

\section*{Height}

\section*{Description}

This is the height of the picture.

\section*{Syntax}

\section*{1 Picture[Index].Height}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Picture[1].Height }
\end{aligned}
\]

\section*{Magnification}

\section*{Description}

This is the magnification of the picture. This value is in percent (e. g. 100 equals to \(100 \%\) what whould be the normal size). This value should be in the range of 1 to 2000 .

\section*{Syntax}

\section*{1 Picture[Index].Magnification}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Picture[1].Magnification } \\
& \hline
\end{aligned}
\]

\section*{Transparency}

\section*{Description}

This is the transparency of the picture. This value is in percent (e. g. 0 means that the picture is not transparent). This value should be in the range of 0 to 100 .

\section*{Syntax}

\section*{1 Picture[Index].Transparency}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Picture[1].Transparency }
\end{aligned}
\]

\section*{Red}

\section*{Description}

This is the red coloration of the picture. This value is in percent (e. g. 100 is the default view). This value should be in the range of 0 to 200 .

\section*{Syntax}

\section*{1 Picture[Index].Red}

\section*{Data type}

Dword
Type
Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Picture[1].Red }
\end{aligned}
\]

\section*{Green}

\section*{Description}

This is the green coloration of the picture. This value is in percent (e. g. 100 is the default view). This value should be in the range of 0 to 200 .

\section*{Syntax}

\section*{1 Picture[Index]. Green}

\section*{Data type}

Dword
Type
Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Picture[1].Green }
\end{aligned}
\]

\section*{Blue}

\section*{Description}

This is the blue coloration of the picture. This value is in percent (e. g. 100 is the default view). This value should be in the range of 0 to 200 .

\section*{Syntax}

\section*{1 Picture[Index].Blue}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Picture[1].Blue }
\end{aligned}
\]

\section*{Chroma}

\section*{Description}

This is the chrominance of the picture. This value is in percent (e. g. 100 is the default view). This value should be in the range of 0 to 200 .

\section*{Syntax}

\section*{1 Picture[Index]. Chroma}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Picture[1]. Chroma }
\end{aligned}
\]

\section*{Action}

\section*{Description}

This is the action of the picture. You can use the action constants for this.
Syntax

\section*{1 Picture[Index].Action}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Range}

0 to 2

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Picture[1].Action }
\end{aligned}
\]

\section*{ActionStrength}

\section*{Description}

This is the action strength of the value of the picture.

\section*{Syntax}

\section*{1 Picture[Index].ActionStrength}

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Range}
-10 to 10

\section*{Example}
```

1 \$
2v[1] = Picture[1].ActionStrength

```

\section*{ActionValue}

\section*{Description}

This is the current action value of the picture.

\section*{Syntax}

\section*{1 Picture[Index].ActionValue}

\section*{Data type}

Double

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Picture[1].ActionValue }
\end{aligned}
\]

At the end \(\mathrm{f}[1]\) whould contain the action value (if the action whould be rotation then this whould be the angle in RPG format) of the first picture.

\section*{MapMove}

\section*{Description}

If this property is true then the move with map property of the picture is used.

\section*{Syntax}
\[
1 \text { Picture[Index]. MapMove }
\]

\section*{Data type}

Switch

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { Picture[1]. MapMove = True }
\end{aligned}
\]

At the end the move with map property of the first picture whould be activated (the picture whould scroll with the map).

\section*{MapX}

\section*{Description}

This is x coordinate used in the show picture command for pictures with activated move with map option.

\section*{Syntax}
\[
1 \text { Picture[Index]. MapX }
\]

\section*{Data type}

Double
Type
Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Picture[1].MapX }
\end{aligned}
\]

\section*{MapY}

\section*{Description}

This is the y coordinate used in the show picture command for pictures with activated move with map option.

\section*{Syntax}
\[
1 \text { Picture[Index]. MapY }
\]

\section*{Data type}

Double
Type
Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Picture[1].MapY }
\end{aligned}
\]

\section*{Pixel}

\section*{Description}

You cann access pixels with this property. This property requires a two dimensional index. The first value is the \(x\) coordinate and the second value is the \(y\) coordinate. The first pixel is at \([0,0]\) and the last pixel is at [width 1 , height -1 ]. The boundaries may not be exceeded. The value of a pixel is the index of the used palette entry (0 to 255).

\section*{Syntax}

> 1Picture[Index].Pixel[X, Y]

\section*{Data type}

Byte

\section*{Type}

\section*{Property}

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\operatorname{Picture[1].Pixel[0,~} 0]
\end{aligned}
\]

At the end v[1] whould be the index of the palette entry used for the pixel in the upper left corner of the first picture.

\section*{Palette}

\section*{Description}

You can access the color values used in a picture's palette with this property. This option requires an index which responded to the palette entry in the range of 0 to 255 . If you change one or more palette entries you must call FlushPalette to apply the changes.

\section*{Syntax}
```

1 Picture[Index].Palette[Color]

```

\section*{Data type}

Dword

\section*{Type}

Property

\section*{Example}
```

1 \$
2v[1] = Picture[1].Palette[0]

```

At the end v[1] whould contain the RGB color of the first palette entry of the first picture.

\section*{UseMaskColor}

\section*{Description}

If this property is true then the mask color will not be drawn.

\section*{Syntax}

\section*{1 Picture[Index].UseMaskColor}

\section*{Data type}

Switch

\section*{Type}

Property

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \text { Picture[1].UseMaskColor = True }
\end{aligned}
\]

At the end the mask color of the first picture whouldn't be drawn.

\section*{DrawLine}

\section*{Description}

With this option you can draw a one pixel thick line. The start coordinates are X1 and Y1. The end coordinates are (these are not always reached) are X2 and Y2. The color for this line is the index for the palette entry.

\section*{Syntax}

> 1 Picture[Index].DrawLine(X1, Y1, X2, Y2, Color)

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: X1}

\section*{Description}

The x coordinate where the line begins.

\section*{Data type}

Dword

\section*{Parameter: Y1}

Description

The y coordinate where the line begins.

\section*{Data type}

Dword

\section*{Parameter: X2}

\section*{Description}

The x coordinate where the line ends.

\section*{Data type}

Dword

\section*{Parameter: Y2}

\section*{Description}

The y coordinate where the line ends.

\section*{Data type}

Dword

\section*{Parameter: Color}

\section*{Description}

The used palette entry for the color of the line.

Data type

Byte

\section*{Example}

At the end there whould be a line drawn from 0,0 to 24, 24 in the color of the second palette entry (= index 1 ).

\section*{FillRect}

\section*{Description}

You can draw a filled rectangle with this method. The start coordinates are left and top. The end coordinates (these are never reached) are right and bottom. The color for this rectangle is the index for the palette entry.

\section*{Syntax}

\title{
1 Picture[Index].FillRect(Left, Top, Right, Bottom, Color)
}

\section*{Return value}

None
Type
Method

\section*{Parameter: Left}

\section*{Description}

The left border of the rectangle.

\section*{Data type}

Dword

\section*{Parameter: Top}

The upper border of the rectangle.

\section*{Data type}

Dword

\section*{Parameter: Right}

\section*{Description}

The right border +1 of the rectangle (= left + width).

\section*{Data type}

Dword

\section*{Parameter: Bottom}

\section*{Description}

The lower border + 1 of the rectangle (= top + height).

\section*{Data type}

Dword

\section*{Parameter: Color}

\section*{Description}

The used palette entry for the color of the rectangle.

\section*{Data type}

Byte

\section*{Example}
\begin{tabular}{l}
\(1 \$\) \$ \\
2 Picture[1].FillRect(0, \(0,24,24,1)\) \\
\hline
\end{tabular}

At the end there whould be a rectangle drawn from 0,0 to (including) 23, 23 in the color of the second palette entry (= index 1 ).

\section*{CopyRect}

\section*{Description}

With this method you can copy a rectangular area from one picture into an other. The palette entries will not be adjusted. So if the source picture has the color red as palette entry 0 and the destination picture has the color green as palette entry 0 then all red pixels (that refer to palette entry 0 ) will be green in the destination picture. X and Y specify the position where the area should be drawn in the current picture. The source id must be a valid picture id of an other (!) picture. The parameters Left, Top, Right and Bottom describe the range and the coordinates of the area in the source picture.

\section*{Syntax}

> 1 Picture[Index].CopyRect(X, Y, 2 Source-ID, Left, Top, Right, Bottom)

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: X}

\section*{Description}

The x coordinate where the area shall be drawn to.

\section*{Data type}

Dword

\section*{Parameter: Y}

\section*{Description}

The y coordinate where the area shall be drawn to.

\section*{Data type}

Dword

\section*{Parameter: Source-ID}

\section*{Description}

The id of the source picture. This value may not the same as the destination picture.

\section*{Data type}

Dword

\section*{Parameter: Left}

\section*{Description}

The left border of the area in the source picture.

\section*{Data type}

Dword

\section*{Parameter: Top}

\section*{Description}

The upper border of the area in the source picture.

\section*{Data type}

Dword

\section*{Parameter: Right}

\section*{Description}

The right border +1 of the area in the source picture (= left + width).

\section*{Data type}

Dword

\section*{Parameter: Bottom}

\section*{Description}

The lower border +1 of the area in the source picture (= top + height).

\section*{Data type}

Dword

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \text { Picture[1].CopyRect(0, 0, 2, 0, 0, 24, } 24)
\end{aligned}
\]

At the end there whould be a rectangular area copied from the second picture to the first which is at 0,0 and has a size of \(24 \times 24\) pixels.

\section*{BltRect}

\section*{Description}

With this method you can copy a rectangular area from one picture into an other, but the specified mask color will be skipped. The palette entries will not be adjusted. So if the source picture has the color red as palette entry 0 and the destination picture has the color green as palette entry 0 then all red pixels (that refer to palette entry 0 ) will be green in the destination picture. X and Y specify the position where the area should be drawn in the current picture. The source id must be a valid picture id of an other (!) picture. The parameters Left, Top, Right and Bottom describe the range and the coordinates of the area in the source picture.

\section*{Syntax}

> 1 Picture[Index].CopyRect(X, Y, 2 Source-ID, Left, Top, Right, Bottom, MaskColor)

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: X}

\section*{Description}

The x coordinate where the area shall be drawn to.

\section*{Data type}

Dword

\section*{Parameter: Y}

\section*{Description}

The y coordinate where the area shall be drawn to.

\section*{Data type}

Dword

\section*{Parameter: Source-ID}

\section*{Description}

The id of the source picture. This value may not the same as the destination picture.

Data type

Dword

\section*{Parameter: Left}

\section*{Description}

The left border of the area in the source picture.

\section*{Data type}

Dword

\section*{Parameter: Top}

\section*{Description}

The upper border of the area in the source picture.

\section*{Data type}

Dword

\section*{Parameter: Right}

Description

The right border +1 of the area in the source picture (= left + width).

\section*{Data type}

Dword

\section*{Parameter: Bottom}

\section*{Description}

The lower border +1 of the area in the source picture ( \(=\) top + height).
Data type
Dword

\section*{Parameter: MaskColor}

\section*{Description}

Specifies the palette entry whose pixels shall not be copied.

\section*{Data type}

Byte

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \text { Picture[1].BltRect }(0,0,2,0,0,24,24,0)
\end{aligned}
\]

At the end there whould be a rectangular area copied from the second picture to the first skipping the color 0 . The area is drawn at 0,0 and has a size of \(24 \times 24\) pixels.

\section*{FlushPalette}

\section*{Description}

With this method you can apply changes of a palette.

\section*{Syntax}

\section*{1 Picture[Index].FlushPalette()}

\section*{Return value}

None

\section*{Type}

Method

\section*{Example}
```

1 \$
2 Picture[1].Palette[0] = 0xFF00FF;
3 Picture[1].FlushPalette()

```

At the end the color of the first palette entry whould have been changed to magenta (Color code \#FF00FF) and used to draw the picture.

\author{
< Back

9.16 Picture object

\subsection*{9.17 Client object}

\section*{Description}

You can establish a connection to other computers via the TCP/IP protocol with the Client object. If a connection has been established successfully then you call it a socket. Using such a socket you can send/receive data. In DestinyScript there are two kinds of sockets (= socket types): sockets using the Destiny protocol (= DestinySockets) and such who don't have a specific protocol (= RAW sockets). Sockets that are not longer required should be closed. The Client object requires an index to specify the responded socket. This index is in the range of 0 to 31. The assignment of the index can be done with the Server object if you accept incoming connections.

\section*{List of methods/properties}
\begin{tabular}{|c|c|c|}
\hline Name & Type & Short description \\
\hline Type & Property & The used socket type \\
\hline State & Property & The current connection state \\
\hline LocalIP & Property & The used ip of the own computer \\
\hline LocalPort & Property & The used port of the own computer \\
\hline RemoteIP & Property & The used ip of the other computer \\
\hline RemotePort & Property & The used port of the other computer \\
\hline Connect & Method & Establishes a connection to an other computer \\
\hline Close & Method & Closes an open connection \\
\hline SendVariable & Method & Sends a variable over a DestinySocket \\
\hline SendByte & Method & Sends a byte over a DestinySocket \\
\hline SendWord & Method & Sends a word over a DestinySocket \\
\hline SendDword & Method & Sends a dword over a DestinySocket \\
\hline SendDouble & Method & Sends a double over a DestinySocket \\
\hline SendString & Method & Sends a string over a DestinySocket \\
\hline SendSwitch & Method & Sends a switch over a DestinySocket \\
\hline SendRawData & Method & Sends data over a RAW socket \\
\hline GetRecvType & Method & Returns the kind of received data from a DestinySocket \\
\hline GetRecvLength & Method & Returns the number of bytes received on a socket \\
\hline RecvID & Method & Receives the id from the current data package of a DestinySocket \\
\hline RecvVariable & Method & Receives a variable from a DestinySocket \\
\hline RecvByte & Method & Receives a byte from a DestinySocket \\
\hline RecvWord & Method & Receives a word from a DestinySocket \\
\hline RecvDword & Method & Receives a dword from a DestinySocket \\
\hline & & \\
\hline
\end{tabular}
\begin{tabular}{||l||l|l||} 
RecvDouble & Method & Receives a double from a DestinySocket \\
\hline \hline RecvString & Method & Receives a string from a DestinySocket \\
\hline RecvSwitch & Method & Receives a switch from a DestinySocket \\
\hline \hline RecvRawData & Method & Receives data from a RAW socket \\
\hline \hline
\end{tabular}

\section*{Type}

\section*{Description}

This property specifies whether DestinySocket \((=0)\) or a RAW socket \((=1)\) is used. You can use the socket type constants for this.

\section*{Syntax}

\section*{1 Client[Index]. Type}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Client[0].Type }
\end{aligned}
\]

\section*{State}

\section*{Description}

This property represents the current state of the socket. You can use the socket state constants for this.

\section*{Syntax}

\section*{1 Client[Index].State}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Client [0].State }
\end{aligned}
\]

\section*{LocallP}

\section*{Description}

The value of this property is the ip used on the own computer for the connection.

\section*{Syntax}

\section*{1 Client [Index]. LocalIP}

\section*{Data type}

String
Type
Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { Client }[0] . \text { LocalIP }
\end{aligned}
\]

\section*{LocalPort}

\section*{Description}

The value of this property is the port used on the own computer for the connection.

\section*{Syntax}

\section*{1 Client[Index]. LocalPort}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Range}

1 to 65535

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Client[0].LocalPort }
\end{aligned}
\]

\section*{RemoteIP}

\section*{Description}

The value of this property is the ip used on the other computer for the connection.

\section*{Syntax}

\section*{1 Client[Index].RemoteIP}

\section*{Data type}

String
Type
Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { Client[0].RemoteIP }
\end{aligned}
\]

\section*{RemotePort}

\section*{Description}

The value of this property is the port used on the other computer for the connection.

\section*{Syntax}

\section*{1 Client[Index].RemotePort}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Range}

1 to 65535

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Client[0].RemotePort }
\end{aligned}
\]

\section*{Connect}

\section*{Description}

You can establish a connection with this method using the the TCP/IP protocol. If you call this method you define whether it uses a DestinySocket or a RAW socket. Because the windows function used to establish a connection is a "blocking call" the DestinyScript (and even the game) will freeze until a connection is established or the timeout occured. The timeout value is ca. 2 seconds. If a connection has been established or not can be checked with the state property of this object.

\section*{Syntax}

> 1 Client[Index].Connect(Address, Port, Sockettype)

\section*{Return value}

None
Type
Method

\section*{Parameter: Address}

\section*{Description}

The address of the destination computer. This can either be an ip (e. g. "192.168.1.1") or a hostname (e. g. "bananen-joe.de").

Data type

String

\section*{Parameter: Port}

\section*{Description}

The port of the destination computer. (e. g. Port 80 for http)

\section*{Data type}

Dword

\section*{Range}

1 to 65535

\section*{Parameter: Sockettype}

\section*{Description}

The socket type for the connection. This can be either DestinySocket (= 0) or RAW socket (=1). You can use the socket constants for this.

\section*{Data type}

Dword

\section*{Range}

0 to 1

\section*{Example}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { Client [0]. Connect ("bananen-joe.de", 80, }
\end{aligned}
\]

At the end a connection via internet whould be established to the webserver "bananen-joe.de".

\section*{Close}

\section*{Description}

With this method an open connection can be closed. If a socket is closed it can be used to open a new connection. If you close a already closed socket this doesn't raise any problems.

\section*{Syntax}

\section*{1 Client[Index].Close()}

\section*{Return value}

None

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { Client [0]. Close( ) }
\end{aligned}
\]

\section*{SendVariable}

\section*{Description}

With this method you can send a variable over a connected DestinySocket. This method can't be used with RAW sockets.

\section*{Syntax}
\[
1 \text { Client[Index].SendVariable(ID, Variable) }
\]

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: ID}

\section*{Description}

The index of the variable. This value may differ from the real variable index.

\section*{Data type}

Dword

\section*{Parameter: Variable}

\section*{Description}

The value of the variable.

\section*{Data type}

Dword

\section*{Example}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { Client[0].SendVariable(1, v[1]) } \\
& \hline
\end{aligned}
\]

At the end the value of the first variable whould be send over the first socket (which is a connected DestinySocket).

\section*{SendByte}

\section*{Description}

With this method you can send a byte over a connected DestinySocket. This method can't be used with RAW sockets.

\section*{Syntax}
\[
1 \text { Client[Index].SendByte(ID, Byte) }
\]

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: ID}

\section*{Description}

The associated index of the byte.

\section*{Data type}

Dword

\section*{Parameter: Byte}

Description

The value of the byte.

\section*{Data type}

Byte

\section*{Example}
\begin{tabular}{|l|l|}
\hline 1 & \$ \\
2 & Client[0].SendByte(1, v[1]) \\
\hline
\end{tabular}

At the end the value of the first variable whould be send (as byte) over the first socket (which is a connected DestinySocket).

\section*{SendWord}

\section*{Description}

With this method you can send a word over a connected DestinySocket. This method can't be used with RAW sockets.

\section*{Syntax}
\[
1 \text { Client[Index].SendWord(ID, Word) }
\]

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: ID}

\section*{Description}

The associated index of the word.

\section*{Data type}

Dword

\section*{Parameter: Word}

\section*{Description}

The value of the word.

\section*{Data type}

> Word

\section*{Example}

\section*{1 \$ 2 Client[0].SendWord(1, v[1])}

At the end the value of the first variable whould be send (as dword) over the first socket (which is a connected DestinySocket).

\section*{SendDword}

\section*{Description}

With this method you can send a dword over a connected DestinySocket. This method can't be used with RAW sockets.

\section*{Syntax}
\[
1 \text { Client[Index].SendDword(ID, Dword) }
\]

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: ID}

\section*{Description}

The associated index of the dword.

\section*{Data type}

Dword

\section*{Parameter: Dword}

Description

The value of the dword.

\section*{Data type}

Dword

\section*{Example}
\begin{tabular}{|ll|}
\hline 1 & \$ \\
2 & Client[0].SendDword(1, d[1]) \\
\hline
\end{tabular}

At the end the value of the first dword whould be send over the first socket (which is a connected DestinySocket).

\section*{SendDouble}

\section*{Description}

With this method you can send a double over a connected DestinySocket. This method can't be used with RAW sockets.

\section*{Syntax}
\[
1 \text { Client[Index].SendDouble(ID, Double) }
\]

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: ID}

\section*{Description}

The associated index of the double.

\section*{Data type}

Dword

\section*{Parameter: Double}

Description

The value of the double.

\section*{Data type}

Double

\section*{Example}

\section*{1 \$ \\ 2 Client [0]. SendDouble(1, f[1])}

At the end the value of the first double whould be send over the first socket (which is a connected DestinySocket).

\section*{SendString}

\section*{Description}

With this method you can send a string over a connected DestinySocket. The string may not exceed a length of 255 chars. This method can't be used with RAW sockets.

\section*{Syntax}

\section*{1 Client[Index].SendString(ID, String)}

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: ID}

\section*{Description}

The associated index of the string.

\section*{Data type}

Dword

\section*{Parameter: String}

\section*{Description}

The value of the string. This value may not exceed 255 chars!

\section*{Data type}

String

\section*{Example}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { Client[0].SendString(1, a[1]) } \\
& \hline
\end{aligned}
\]

At the end the value of the first string whould be send over the first socket (which is a connected DestinySocket).

\section*{SendSwitch}

\section*{Description}

With this method you can send a switch over a connected DestinySocket. This method can't be used with RAW sockets.

\section*{Syntax}
\[
1 \text { Client[Index].SendSwitch(ID, Switch) }
\]

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: ID}

\section*{Description}

The associated index of the switch.

\section*{Data type}

Dword

\section*{Parameter: Switch}

\section*{Description}

The value of the switch.

\section*{Data type}

\author{
Switch
}

\section*{Example}
\begin{tabular}{|l|l|}
\hline 1 & \$ \\
2 & Client[0].SendSwitch(1, \(s[1])\) \\
\hline
\end{tabular}

At the end the value of the first string whould be send over the first socket (which is a connected DestinySocket).

\section*{SendRawData}

\section*{Description}

With this method you can send a specified amount of data over a RAW socket. The data is processed binary, so it is possible to send less data than the value contains (e. g. you can send 4 bytes of a double although it is usually 8 bytes long). This method can't be used with DestinySockets.

\section*{Syntax}
```

1 Client[Index].SendRawData(Datasource, Length)

```

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: Datasource}

\section*{Description}

The data source where the bytes are taken from.

Data type

Alle
Parameter: Length

\section*{Description}

The number of bytes being send. This may not exceed the length of the data source. For example you can't send 9 bytes from a double (which has a maximum length of 8 bytes).

\section*{Data type}

\author{
Dword
}

\section*{Example}
```

1 \$
2a[1] = "GET / HTTP/1.0" + CRLF +
3 "Host: bananen-joe.de" + CRLF + CRLF;
4 Client[0].SendRawData(a[1],
String.Length(a[1]))

```

At the end content of a[1] (which is a http request header) whould be send over a RAW socket (compare the example of connect) to the webserver "bananen-joe.de".

\section*{GetRecvType}

\section*{Description}

With this method you can determine whether a data packet has been received completely. If the return value is negative value then the data paket isn't complete (the return value is the negative data type), otherwise (if the return value is positive) the data paket is complete and the return value tells you what kind it is. You can use the data type constants for this. If there is no data paket this method will return 0 . This method can only be used with DestinySockets. If you call this method the Destiny.dll will receive data on this socket if possible.

\section*{Syntax}

1 Client[Index].GetRecvType()

\section*{Return value}

Dword

\section*{Type}

Method

\section*{Example}
```

1 \$
2 v[1] = Client[0].GetRecvType()

```

Am Ende wäre v[1] der Data type des zuletzt empfangenen Datenpakets bei einem verbundenen DestinySocket. Wenn Examplesweise der andere Computer mit SendVariable eine Variable versendet hätte, würde hier die Zahl 1 (= TYPE_VARIABLE) zurückgegeben werden.

\section*{GetRecvLength}

\section*{Description}

Returns the number of received data (in bytes). This value can't be more than 500 bytes due to a weakness of the Destiny.dll (the internal buffer is limited to 500 bytes). This method can be used with each socket type. If you call this method the Destiny.dll will receive data on this socket if possible.

\section*{Syntax}

\section*{1 Client [Index].GetRecvLength()}

\section*{Return value}

Dword

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Client[0].GetRecvLength() }
\end{aligned}
\]

\section*{RecvID}

\section*{Description}

Receives the associated id of the current data package. This method must be called implicitly before other recv methods are called on DestinySockets (except for GetRecvType and GetRecvLength) because these methods remove the current data package from the internal buffer. RecvID doesn't remove the current data package from the internal buffer. This method can only be used with DestinySockets.

\section*{Syntax}

1 Client[Index].RecvID( )

\section*{Return value}

Dword

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Client[0].RecvID() }
\end{aligned}
\]

At the end \(\mathrm{v}[1]\) whould contain the id of the last received data package on a connected DestinySocket. For example if the other computer executes SendVariable \((1,2)\) this method (on our computer) whould return 1.

\section*{RecvVariable}

\section*{Description}

Receives the variable value of the current data package and removes that data package from the internal buffer. This method can only be used with DestinySockets.

\section*{Syntax}

\section*{1 Client[Index].RecvVariable()}

\section*{Return value}

Dword

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Client[0].RecvVariable() } \\
& \hline
\end{aligned}
\]

At the end v[1] whould contain the variable value of the last received data package on a connected DestinySocket. For example if the other computer executes SendVariable \((1,2)\) this method (on our computer) whould return 2.

\section*{RecvByte}

\section*{Description}

Receives the byte value of the current data package and removes that data package from the internal buffer. This method can only be used with DestinySockets.

\section*{Syntax}

\section*{1 Client[Index].RecvByte()}

\section*{Return value}

Byte

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Client[0].RecvByte() }
\end{aligned}
\]

\section*{RecvWord}

\section*{Description}

Receives the word value of the current data package and removes that data package from the internal buffer. This method can only be used with DestinySockets.

\section*{Syntax}

1 Client[Index].RecvWord()

\section*{Return value}

Word

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Client[0].RecvWord() }
\end{aligned}
\]

\section*{RecvDword}

\section*{Description}

Receives the dword value of the current data package and removes that data package from the internal buffer. This method can only be used with DestinySockets.

\section*{Syntax}

\section*{1 Client[Index].RecvDword()}

\section*{Return value}

Dword

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{v}[1]=\text { Client[0].RecvDword() }
\end{aligned}
\]

\section*{RecvDouble}

\section*{Description}

Receives the double value of the current data package and removes that data package from the internal buffer. This method can only be used with DestinySockets.

\section*{Syntax}

\section*{1 Client[Index].RecvDouble()}

\section*{Return value}

Double

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Client [0].RecvDouble() }
\end{aligned}
\]

\section*{RecvString}

\section*{Description}

Receives the string value of the current data package and removes that data package from the internal buffer. This method can only be used with DestinySockets.

\section*{Syntax}

\section*{1 Client[Index].RecvString()}

\section*{Return value}

String

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { Client[0].RecvString() }
\end{aligned}
\]

\section*{RecvSwitch}

\section*{Description}

Receives the switch value of the current data package and removes that data package from the internal buffer. This method can only be used with DestinySockets.

\section*{Syntax}

\section*{1 Client[Index].RecvSwitch()}

\section*{Return value}

Switch

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { Client[0].RecvSwitch() }
\end{aligned}
\]

\section*{RecvRawData}

\section*{Description}

Receives a specified amount of bytes and returns this value as a specified data type. If the data type has a minimum length (e. g. double requires 8 bytes total) the missing bytes will be filled with zeros. Finally the received amount of bytes will be removed from the internal buffer. The amount of bytes may not exceed 500 bytes. This method can only be used with RAW sockets.

\section*{Syntax}
\[
1 \text { Client[Index].RecvRawData(DataType, Length) }
\]

\section*{Return value}

Depends on the parameter DataType.

\section*{Type}

Method

\section*{Parameter: DataType}

\section*{Description}

Defines the data type used for the return value. You can use the data type constants for this.

\section*{Data type}

Dword

\section*{Range}

1 to 7

\section*{Parameter: Length}

\section*{Description}

Defines the number of bytes to receive. If this value is too small for the specified data type then the missing bytes will be filled with zero bytes.

\section*{Data type}

Dword

\section*{Range}

1 to 500

\section*{Example}
```

1 \$
2v[1] = Client[0].GetRecvLength();
3a[1] = Client[0].RecvRawData(TYPE_STRING,
v[1])

```

At the end a[1] whould contain a string in the length of the received bytes of the connected RAW socket. Usally there must be checked whether more than 0 bytes are received before the call of RecvRawData.
9.17 Client object

Forward >
9.18 Server object

\subsection*{9.18 Server object}

\section*{Description}

You can accept incoming connections from other computers via the TCP/IP protocol with the Server object. Accepted connections can be accessed via the Client object.

\section*{List of methods/properties}
\begin{tabular}{||l|l|l|}
\hline Name & \multicolumn{1}{|c|}{ Type } & \multicolumn{1}{|c|}{ Short description } \\
\hline Type & Property & The used socket type \\
\hline State & Property & The current connection state \\
\hline \hline Listen & Method & Waits for incoming connections \\
\hline Close & Method & Stops the waiting for incoming connections \\
\hline \hline Accept & Method & Accepts an incoming connection \\
\hline \hline
\end{tabular}

\section*{Type}

\section*{Description}

This property specifies whether accepted connections will be DestinySockets (= 0 ) or RAW-Sockets (= 1). You can use the socket type constants for this. This value will be specified with the call of the listen method.

\section*{Syntax}

\section*{1 Server. Type}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
```

1 \$
2v[1] = Server.Type

```

\section*{State}

\section*{Description}

This property specifies the current state of the server socket. You can use the socket state constants for this.

\section*{Syntax}

\section*{1 Server.State}

\section*{Data type}

Dword

\section*{Type}

Property, read-only

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Server].State }
\end{aligned}
\]

\section*{Listen}

\section*{Description}

With this method you can set the server socket into the listening state. If a server socket is in listening state then it can accept incoming connections.
To accept an incoming connection you can use the accept method. On some computers the firewall can make trouble. In this case it is impossible to accept incoming connections. Fore more specific information see at the known bugs.

\section*{Syntax}
\[
1 \text { Server.Listen(Port, SocketType) }
\]

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: Port}

\section*{Description}

The local port used for incoming connections. The clients must connect to this port if they want to establish a connection.

\section*{Data type}

Dword

\section*{Range}

1 to 65535

\section*{Parameter: SocketType}

\section*{Description}

The socket types of the client sockets that are created using the accept method. You can use the socket type constants for this.

\section*{Data type}

Dword

\section*{Range}

0 to 1

\section*{Example}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { Server.Listen(12345, SOCK_DESTINY) }
\end{aligned}
\]

At the end incoming connections from the network (or internet) whould be able to accept.

\section*{Close}

\section*{Description}

With this method you can close the server socket. In this case no more incoming connections will be accepted. Already connected clients are still connected.

\section*{Syntax}

\section*{1 Server.Close()}

\section*{Return value}

None

\section*{Type}

Method

\section*{Example}
```

1 \$
2 Server.Close()

```

\section*{Accept}

\section*{Description}

With this method you can accept an incoming connection (if there is one). The accepted connection will be dedicated to a Client object. The return value of this method is the index used for the client object that has accepted the connection. If there wasn't an incoming connection pending then this method will return -1 . You can specify a client with the parameter client. If you do so then only this client object will be used to accept a connection and the client socket will be closed if necessary. If the next free socket shall be used then you can use the NEXT_FREE_SOCKET constant (= -1 ).

\section*{Syntax}

\section*{Return value}

\section*{Dword}

\section*{Type}

Method

\section*{Parameter: Client}

\section*{Description}

The index of the client object which shall accept the incoming connection. For the next free client object use the NEXT_FREE_SOCKET constant.

Dword

\section*{Range}
-1 to 31

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Server.Accept (NEXT_FREE_SOCKET) } \\
& \hline
\end{aligned}
\]

At the end v[1] whould contain the index of the client object which has accepted the incoming connection (if there was one). This only works if the server socket was in listening state. If a client has established a connection (and it has been accepted) then you can access this connection (in this example) with Client[v[1]] like a normal client socket.

Forward >
9.17 Client object
9.18 Server object

\subsection*{9.19 File object}

\section*{Description}

You can read/write files with the File object. Due to security reasons each file access is only. possible inside of the game directory. The File object requires an index in the range of 0 to 31 . This index is required to specify which file stream shall be used (in other words you can open multiple files at the same time).

\section*{List of methods/properties}
\begin{tabular}{||l|l|l|}
\hline \multicolumn{1}{|c|}{ Name } & Type & \multicolumn{1}{c|}{ Short description } \\
\hline Open & Method & Opens a file for reading and/or writing \\
\hline Close & Method & Closes a previously opened file \\
\hline ReadRawData & Method & Reads data from the file \\
\hline WriteRawData & Method & Writes data into the file \\
\hline \hline GetFilePointer & Method & Returns the current read/write position of the file \\
\hline \hline SetFilePointer & Method & Sets the current read/write position of the file \\
\hline Length & Method & Returns the current length of the file \\
\hline Truncate & Method & Truncates the rear part of the file \\
\hline \hline
\end{tabular}

\section*{Open}

\section*{Description}

With this method you can open a file for reading/writing. If you open a file for writing and it doesn't exist then it will be created automatically. You can specify only a relative path to the game directory as file name. The parameter file mode specifies either the file shall be opened for reading and/or writing. You can use the file mode constants for this. After opening and reading/writing all required data you must close the file with the close method to ensure that the file handles are free again.

\section*{Syntax}

\section*{1 File[Index].Open(Filename, FileMode)}

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: Filename}

\section*{Description}

Specifies the filename (including the relative path if necessary) of the file which shall be opened. Files may only be opened inside the game directory (and subdirectories)!

Data type

String

\section*{Parameter: FileMode}

\section*{Description}

Specifies whether a file shall be opened for reading/writing. To specify more than one file mode you must use the binary or operator (e. g. FILE_READ | FILE_WRITE). If you open a file for appending it will always be opened with write access. You can use the file mode constants for this parameter.

\section*{Data type}

Dword

\section*{Range}

1 to 7

\section*{Example}
```

1 \$
2 File[0].Open("Textfile.txt", FILE_WRITE)

```

At the end a file with the name "Textfile.txt" whould be opened in the game directory for writing. If this file whould not exist then it whould be created.

\section*{Close}

\section*{Description}

With this method you can close a previously opened file. The file handle will be free again and each writing operation will be finally done. (On some operating systems it is possible that some write operations are only done after you closed the file! Hence you should close the file if you no longer need it.)

\section*{Syntax}

\section*{1 File[Index].Close()}

\section*{Return value}

None

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \text { File[0].Close() }
\end{aligned}
\]

At the end the file previously opened with the open method whould be closed. Hence you can open a file with the File object (using index 0) again.

\section*{ReadRawData}

\section*{Description}

With this method you can read an amount of bytes from a previously opened file (with read access). The first parameter specifies the data type which is used to return the bytes read. You can use the data type constants for this. If you read data from a text file then you should only use strings for reading/writing. The second parameter specifies the amount of bytes which is being read. This value may not exceed the maximum size of the data type (e. g. 8 bytes for double, 4 bytes for dword, ...). If this value is smaller than the maximum size of the specified data type then the missing bytes will be filled with zero-bytes to reach the required length. If you specify (for each data type expect string) a length of 0 bytes then the required number of bytes will be read automatically. After reading the bytes the internal file pointer will be increased automatically by the amount of bytes.

\section*{Syntax}

1 File[Index].ReadRawData(DataType, Length)

\section*{Return value}

Depends on the parameter DataType.

\section*{Type}

Method

\section*{Parameter: Data type}

\section*{Description}

Specifies the data type of the return value. You can use the data type constants for this.

\section*{Data type}

Dword

\section*{Range}

1 to 7

\section*{Parameter: Length}

\section*{Description}

Specifies the amount of bytes that will be read. If this value is too small for the specified data type then the data type will be filles with zero-bytes. You can specify a 0 here for each data type expect string to detect automatically which length is required.

\section*{Data type}

Dword

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { File[0]. ReadRawData(TYPE_STRING, } \\
& \text { File[0]. Length())) }
\end{aligned}
\]

At the end the entire content of a previously opened (text-)file whould be read into a[1].

\section*{WriteRawData}

\section*{Description}

With this method you can write data into a previously opened file (with write access). The first parameter specifies the data source (which contents the bytes to be written). If the target file is a text file then you should only write strings. The second parameter specifies the amount of bytes that shall be written into the file. This value may not exceed the maximum length of the data type used by the data source. You can specify a 0 here to write the entire data source (unlike ReadRawData this works with strings) into the file. After writing the data into the file the internal file pointer will be increased automatically by the amount of bytes written. If you write past the end of file then the file size will increase automatically.

\section*{Syntax}
\[
1 \text { File[Index].WriteRawData(DataSource, Length) }
\]

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: DataSource}

\section*{Description}

Specifies the data source which contains the bytes that shall be written into the file.

\section*{Data type}

\section*{All}

\section*{Parameter: Length}

\section*{Description}

Specifies the amount of bytes that shall be written into the file. If this value is 0 then the entire content of the data source will be written into the file automatically.

\section*{Data type}

Dword

\section*{Example}
```

1 \$
2 File[0].WriteRawData(v[1], 0)

```

At the end the entire content of the first variable whould be written into a (binary) file.

\section*{GetFilePointer}

\section*{Description}

With this method you can retrieve the position of the internal file pointer.

\section*{Syntax}

\section*{1File[Index].GetFilePointer()}

\section*{Return value}

Dword

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { File[0].GetFilePointer() }
\end{aligned}
\]

\section*{SetFilePointer}

\section*{Description}

With this method you can set the new position of the internal file pointer.

\section*{Syntax}

\section*{1 File[Index].SetFilePointer(NewFilePointer)}

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: NewFilePointer}

\section*{Description}

Specifies the new position of the file pointer. This value may not exceed the current file length.

\section*{Data type}

Dword

\section*{Example}
```

1 \$
2 File[0].SetFilePointer(0)

```

At the end the internal file pointer whould point to the begin (=0) of the file.

\section*{Length}

\section*{Description}

With this method you can retrieve the current length of a file.

\section*{Syntax}

\section*{1 File[Index]. Length()}

\section*{Return value}

Dword

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { File[0].Length() } \\
& \hline
\end{aligned}
\]

\section*{Truncate}

\section*{Description}

With this method you can truncate the rear part of a file. The file will be truncated after the position of the internal file pointer. For example you can clear to entire content of a file if the internal file pointer points to the begin of the file \((=0)\). To truncate a file you must open it with write access.

\section*{Syntax}

\section*{1 File[Index].Truncate()}

\section*{Return value}

None

\section*{Type}

Method

\section*{Example}

\section*{1 \$}

2 File[0].SetFilePointer(0);
3 File[0]. Truncate()
At the end the entire file whould be cleared.
9.19 File object

Forward >
9.20 Directory object

\subsection*{9.20 Directory object}

\section*{Description}

You can edit directory and file structures with the Directory object. Additionally you can browse directories. Like at the File object you can only access the game directory and its subdirectories.

\section*{List of methods/properties}
\begin{tabular}{|l|l|l||}
\hline \multicolumn{1}{|c|}{ Name } & Type & \multicolumn{1}{c|}{ Short description } \\
\hline CreateDir & Method & Creates a directory \\
\hline RemoveDir & Method & Removes an empty(!) directory \\
\hline Rename & Method & Renames a file/directory or moves it \\
\hline CopyFile & Method & Copies a file \\
\hline DeleteFile & Method & Deletes a file \\
\hline \hline GetAttributes & Method & Returns the attributes of a file/directory \\
\hline \hline SetAttributes & Method & Sets the attributes of a file/directory \\
\hline FindFirst & Method & Starts to browse a directory \\
\hline FindNext & Method & Continues the browsing of a directory \\
\hline FindClose & Method & Stops the browsing of a directory \\
\hline \hline
\end{tabular}

\section*{CreateDir}

\section*{Description}

With this method you can create a new directory. The name of the directory has a relative path to the game directory.

\section*{Syntax}

\section*{1 Directory.CreateDir(Directory)}

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: Directory}

\section*{Description}

Specifies the name (inclusive the relative path if necessary) of the new directory. You can only create directories inside of the game directory (and subdirectories).

\section*{Data type}

String

\section*{Example}
\begin{tabular}{l}
\begin{tabular}{l}
\begin{tabular}{|l|l|}
\hline 1 \$ \\
2 & Directory. CreateDir( "Picture \(\backslash\) Content")
\end{tabular} \\
At the end a new subdirectory whould be created with the name "Content" \\
in the Picture folder.
\end{tabular} \\
\hline
\end{tabular}

\section*{RemoveDir}

\section*{Description}

With this method you can remove an empty directory. The name of the directory has a relative path to the game directory.

\section*{Syntax}

\section*{1 Directory.RemoveDir(Directory)}

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: Directory}

\section*{Description}

Specifies the name (inclusive the relative path if necessary) of the directory that shall be removed. You can only remove directories inside of the game directory (and subdirectories).

\section*{Data type}

String

\section*{Example}
\begin{tabular}{|l|l|}
\hline 1 & \$ \\
2 Directory.RemoveDir("Testfolder") \\
\hline
\end{tabular}

At the end the directory with the name "Testfolder"e; (which is inside of the game directory) whould be removed.

\section*{Rename}

\section*{Description}

With this method you can rename or move files and directories. A file/directory is moved if it gets a new path (without a new name). Otherwise it will be renamed (and moved if the path is different).

\section*{Syntax}

\section*{1 Directory.Rename(OldPath, NewPath)}

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: OldPath}

\section*{Description}

Specifies the current (relative) path of the file/directory. You can only rename files/directories inside of the game directory (and subdirectories).

\section*{Data type}

String

\section*{Parameter: NewPath}

Specifies the new (relative) path of the file/directory. You can only rename files/directories inside of the game directory (and subdirectories).

\section*{Data type}

String

\section*{Example}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { Directory.Rename("Folder old\File.txt", } \\
& 3 \text { "Folder new\File.txt); } \\
& 4 \text { Directory.Rename("Folder old\Subfolder", } \\
& 5 \text { "Folder old\Subfolder2) } \\
& \hline
\end{aligned}
\]

At the end the file "File.txt" whould be moved from the directory "Folder old" into the directory "Folder new" (Line 2 \& 3). Additionally the directory "Subfolder" whould be renamed to "Subfolder2" (Line 4 \& 5).

\section*{CopyFile}

\section*{Description}

With this method you can copy files.

\section*{Syntax}

\section*{1 Directory.CopyFile(SourceFile, DestinationFile)}

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: SourceFile}

\section*{Description}

Specifies the (relative) path of the file which shall be copied. You can only copy files inside of the game directory (and subdirectories).

\section*{Data type}

String

\section*{Parameter: DestinationFile}

\section*{Description}

Specifies the (relative) path of the copy. You can only copy files inside of the game directory (and subdirectories).

\section*{Data type}

String

\section*{Example}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { Directory. CopyFile("RPG_RT.exe", } \\
& \text { "RPG_RT2.exe") } \\
& \hline
\end{aligned}
\]

At the end the file "RPG_RT.exe" whould be copied as "RPG_RT2.exe".

\section*{DeleteFile}

\section*{Description}

With this method you can delete files.

\section*{Syntax}

\section*{1 Directory.DeleteFile(File)}

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: File}

\section*{Description}

Specifies the (relative) path of the file that shall be deleted. You can only delete files inside of the game directory (and subdirectories).

\section*{Data type}

String

\section*{Example}
```

1 \$
2 Directory.DeleteFile("Test.txt")

```

At the end the file "Test.txt" whould be deleted.

\section*{GetAttributes}

\section*{Description}

With this method you can retrieve the attributes of a file/directory. The return value is a combination of the file attribute constants.

\section*{Syntax}

\section*{1 Directory.GetAttributes(Path)}

\section*{Return value}

Dword

\section*{Type}

Method

\section*{Parameter: Path}

\section*{Description}

Specifies the (relative) path of the file/directory whose attributes shall be retrieved. You can only access the attributes of files/directories inside of the game directory (and subdirectories).

\section*{Data type}

String

\section*{Example}
\begin{tabular}{|l}
\hline \(1 \$\) \\
\(2 \mathrm{v}[1]=\) Directory.GetAttributes("Test.txt") \\
\hline
\end{tabular}

\section*{SetAttributes}

\section*{Description}

With this method you can set the attributes of a file/directory. You can use (and combine) the file attribute constants for this. You can't convert directories into files (or vice versa).

\section*{Syntax}

\section*{1 Directory.SetAttributes(Path, NewAttributes)}

\section*{Return value}

None

\section*{Type}

Method

\section*{Parameter: Path}

\section*{Description}

Specifies the (relative) path of the file/directory whose attributes shall be set. You can only set the attributes of files/directories inside of the game directory (and subdirectories).

Data type

String

\section*{Parameter: NewAttributes}

\section*{Description}

Specifies the new attributes of the file/directory. You can use (and combine) the file attribute constants for this. Files may not have the attribute FILE_ATTRIBUTE_DIRECTORY.

\section*{Data type}

\author{
Dword
}

\section*{Example}
\[
\begin{aligned}
& \text { 1 \$ } \\
& 2 \text { Directory.SetAttributes("Test.txt", } \\
& \text { FILE_ATTRIBUTE_HIDDEN) }
\end{aligned}
\]

At the end the file "Test.txt" whould be marked as hidden.

\section*{FindFirst}

\section*{Description}

With this method you can start to browse a directory. You can specify the search options with the parameter search pattern. To continue the browsing (and even find all files/directories) you must call the method FindNext in a loop. During each browsing you find first the directories "." and "..". "." is the current directory and ".." is the parent directory. If you don't need this information you should skip it. This method is equivalent to the windows function FindFirstFile.

\section*{Syntax}

\section*{1 Directory.FindFirst(SearchPattern)}

\section*{Return value}

String

\section*{Type}

Method

\section*{Parameter: SearchPattern}

\section*{Description}

Specifies the (relative) path of the browsing directory including the placeholders. You can use the asterisk (*) and the question mark (?) as placeholder. The asterisk stands for any number of unknown chars and the question mark stand for exact one unknown char. To browse effectively you must use at least one of these placeholders. You can only access files/directories inside of the game directory (and subdirectories).

\section*{Data type}

\author{
String
}

\section*{Example}
\begin{tabular}{|l|}
\hline \(1 \$\) \\
\(2 \mathrm{a}[1]=\) Directory.FindFirst("*. lmu") \\
\hline
\end{tabular}

At the end a[1] whould contain the filename of the first map of the game (= files in the gamedirectory with the extension lmu are maps).

\section*{FindNext}

\section*{Description}

After starting to browse a directory using the FindFirst method you can continue browsing using this method. After each call this method returns the filename of the next matching file/directory. If this method returns an empty string then the browsing is finished and it must be closed using FindClose.

\section*{Syntax}

\section*{1 Directory.FindNext()}

\section*{Return value}

String

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { Directory.FindNext() }
\end{aligned}
\]

At the end a[1] whould contain the next matching file/directory of a browsing. This command should be used in a loop until it returns an empty string (in this example a[1] whould be empty).

\section*{FindClose}

\section*{Description}

With this method you can close a previously started browsing.

\section*{Syntax}

\section*{1 Directory.FindClose()}

\section*{Return value}

None

\section*{Type}

Method

\section*{Example}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { Directory. FindClose( ) }
\end{aligned}
\]

\section*{10. Error messages}

\section*{Description}

During the execution of a DestinyScript the can occur errors on different places. A list of all errors (and their meanings) is listed here.

\section*{List of errors}
\begin{tabular}{|c|c|c|}
\hline Nummer & Name of constant & Short description \\
\hline 0 & ERROR_UNKNOWN & An unknown error \\
\hline 1 & ERROR_SYNTAX & Unexpected chars are used in the DestinyScript \\
\hline 2 & ERROR_NOVALUE & A value is expected but no one is denoted \\
\hline 3 & ERROR_UNKNOWNNAME & An unknown name was used \\
\hline 4 & ERROR_CONVERT & A value couldn't be converted due to an unknown reason \\
\hline 5 & ERROR_READONLY & It was tried to write a read-only value \\
\hline 6 & ERROR_ARRAYBOUND & The used index exceeds the boundaries \\
\hline 7 & ERROR_RANGE & A value couldn't be converted because it is out of the range of the destination data type \\
\hline 8 & ERROR_MEMORY & The isn't sufficient free memory available \\
\hline 9 & ERROR_VALUE & An invalid value has been used for a parameter \\
\hline 10 & ERROR_BINARYFLOAT & It was tried to execute a binary operation with a floating point number \\
\hline 11 & ERROR_CALCSWITCH & It was tried to calculate with a switch \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|}
\hline 12 & |ERROR_CALCSTRING & It was tried to calculate with a string \\
\hline 13 & ERROR_FLOATERROR & An error occured during a floating point operation \\
\hline 14 & ERROR_FLOATLENGTH & To much places have been denoted for a floating point number \\
\hline 15 & ERROR_DIVISIONBYZERO & It was tried to divide by zero \\
\hline 16 & ERROR_STRINGFORMAT & A string has an invalid format so it couldn't be converted \\
\hline 17 & ERROR_STRINGRANGE & It was tried to access a char which exceeds the length of the string \\
\hline 18 & ERROR_PICTURE & A picture hasn't been loaded \\
\hline 19 & ERROR_PIXELRANGE & It was tried to access an area that exceed the boundaries of a picture \\
\hline 20 & ERROR_SAMEPICTURE & It was tried to use the same source and destination picture \\
\hline 21 & ERROR_PALETTERANGE & It was tried to access a palette entry which exceeds the 256 colors palette \\
\hline 22 & ERROR_SOCKETSTARTUP & The socket system couldn't be initialized \\
\hline 23 & ERROR_NOFREESOCKET & There are no more free sockets available \\
\hline 24 & ERROR_CANTCREATESOCKET & It was not possible to create a socket \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|}
\hline | 25 & ERROR_SOCKETSTILLOPEN & It was tried to open a socket while its already open \\
\hline 26 & ERROR_SOCKETNOTOPEN & It was tried to use a socket method which requires an open socket \\
\hline 27 & ERROR_CANTCONNECT & It was not possible to connect to the specified address \\
\hline 28 & ERROR_SOCKETTYPE & It was tried to use a socket method which is appointed for an other socket type \\
\hline 29 & ERROR_SOCKETERROR & An unknown error occured during the access of a socket \\
\hline 30 & ERROR_OOB & Out of band data (garbage) has been received on a DestinySocket \\
\hline 31 & ERROR_STRINGTOOLONG & It was tried to send a string which is longer than 255 bytes \\
\hline 32 & ERROR_NOFREEFILEHANDLE & It was tried to open an already open file handle \\
\hline 33 & ERROR_CANTRESOLVEPATH & It was not possible to resolve a path \\
\hline 34 & ERROR_NOPERMISSION & It was tried to access a path outside of the game directory \\
\hline 35 & ERROR_CANTOPENFILE & It was not possible to open a file \\
\hline 36 & ERROR_FILENOTOPEN & It was tried to use a file function which requires \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|}
\hline & & an open file \\
\hline 37 & ERROR_CANTACCESSFILE & It was not possible to access a file \\
\hline 38 & ERROR_CANTCREATEDIR & It was not possible to create a directory \\
\hline 39 & ERROR_CANTREMOVEDIR & It was not possible to remove a directory \\
\hline 40 & ERROR_CANTRENAMEFILE & It was not possible to rename/move a file/directory \\
\hline 41 & ERROR_CANTCOPYFILE & It was not possible to copy a file \\
\hline 42 & ERROR_CANTDELETEFILE & It was not possible to delete a file \\
\hline 43 & ERROR_CANTREADATTRIBUTES & It was not possible to retrieve the attributes of a file/directory \\
\hline 44 & ERROR_CANTWRITEATTRIBUTES & It was not possible to set the attributes of a file/directory \\
\hline 45 & ERROR_SEARCHSTILLOPEN & A directory browsing is already started \\
\hline 46 & ERROR_CANTSTARTSEARCH & It was not possible to start a directory browsing \\
\hline 47 & ERROR_NOSEARCHSTARTED & It was tried to use a method which requires an already started directory browsing \\
\hline
\end{tabular}

\section*{Error 0: ERROR_UNKNOWN}

\section*{Description}

This error may never occur. It is only here to cover the impossible case.

\section*{Error 1: ERROR_SYNTAX}

\section*{Description}

This error occurs if an invalid char has been used in DestinyScript. This could happen whether there are too much parameters declared (in that case the interpreter want's a closing parenthesis and not a comma).

\section*{Example of the error}
\[
\begin{aligned}
& 1 \$ \\
& 2 \text { : }
\end{aligned}
\]

\section*{Error 2: ERROR_NOVALUE}

\section*{Description}

This error occurs if a value is required but no one is specified. This could be an empty pair of parantheses in a formula or simply a missing term.

\section*{Example of the error}
\[
\begin{aligned}
& 1 \$ \\
& 2 v[1]=3+()+1
\end{aligned}
\]

\section*{Error 3: ERROR_UNKNOWNNAME}

\section*{Description}

This error occurs if a name (this means name of an object, method, property, constant or scope) has been denoted that doesn't exist.

\section*{Example of the error}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Picture[1].Toast }
\end{aligned}
\]

The Picture object has no property with the name "Toast".

\section*{Error 4: ERROR_CONVERT}

\section*{Description}

This error may never occur. It whould only occur if the interpreter tries to convert a not specified value.

\section*{Error 5: ERROR_READONLY}

\section*{Description}

This error occurs if it is tried to write a read-only (this means writeprotected) value. Wheter a value is read-only or not is written in its definition.

\section*{Example of the error}
\[
\begin{aligned}
& 1 \$ \\
& 2 \text { Destiny.DllVersionMajor }=100
\end{aligned}
\]

The property "DllVersionMajor" of the Destiny object is declared as readonly.

\section*{Error 6: ERROR_ARRAYBOUND}

\section*{Description}

This error occurs if an invalid index is used. For example if the range is defined as 1 to 100 then all indices less than 1 or bigger than 100 are invalid.

\section*{Example of the error}
\[
\begin{aligned}
& 1 \$ \\
& 2 \text { Picture[-1].UseMaskColor = False }
\end{aligned}
\]

The index of the Picture object start with 1. Hence each negative index is invalid.

\section*{Error 7: ERROR_RANGE}

\section*{Description}

A data type with a huge value was tried to be converted into a data type with a small range. For example the data type byte allows only values in the range from 0 to 255 . So it is not possible to convert a value smaller than 0 or bigger than 255 into a byte.

\section*{Example of the error}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=\text { Math. } \operatorname{Exp}(11) ; \\
& 3 \mathrm{v}[1]=\mathrm{f}[1]
\end{aligned}
\]

The error occurs in line 3. \(\mathrm{f}[1]\) is \(100,000,000,000\) but the maximum value of dword is \(2,147,483,647\). Hence it is not possible to store the huge value into the small data type.

\section*{Error 8: ERROR_MEMORY}

\section*{Description}

There is not enough memory available to execute a command. For example this could happen if it is tried to allocate a string which is some giga bytes long. This error can depend on the used target computer system where the game is running. In this case a reboot of the computer could help.

\section*{Example of the error}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \mathrm{a}[1]+=\mathrm{a}[1]+\text { String.Fill("This is just" + } \\
& 3 \text { "a long example string", 1000) }
\end{aligned}
\]

If this DestinyScript is executed in a (endless) loop then a[1] will grow and grow and grow... In theory this could raise the error if there is insufficient memory.

\section*{Error 9: ERROR_VALUE}

\section*{Description}

An invalid value has been specified for a parameter. Which values are valid for a parameter is written in the definition of its method. For the most parameters, where ranges are definied, you can use constants.

\section*{Example of the error}
```

1 \$
2 Server.Listen(1000000, SOCK_DESTINY)

```

The first parameter of the listen methods specifies the port where the socket will listen on. The range of this port specified as 1 to 65535 . The value 1000000 exceeds this range.

\section*{Error 10: ERROR_BINARYFLOAT}

\section*{Description}

This error occurs when it is tried to apply a binary operation (AND, OR, NOT and XOR) with a floating point number. Binary operations are only allowed for integer data types (byte, word and dword).

\section*{Example of the error}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1] \quad \&=1
\end{aligned}
\]

The used operator is an AND operator and not valid for an operation with the floating point number f[1].

\section*{Error 11: ERROR_CALCSWITCH}

\section*{Description}

This error occurs if it is tried to calculate with switches. This includes arithmetical and binary operations.

\section*{Example of the error}
\[
\begin{aligned}
& 1 \$ \$ \\
& 2 \mathrm{~s}[1]+=1
\end{aligned}
\]

The used operator is an addition operator. Because s[1] is a switch this is invalid.

\section*{Information \\ To apply logical operations with switches you can use the Logic object.}

\section*{Error 12: ERROR_CALCSTRING}

\section*{Description}

This error occurs if it is tried to calculate with strings. This includes arithmetical and binary operations. The only operator, which may be used with strings (additionally to the set operator), is the addition operator which is used to concatenate strings.

\section*{Example of the error}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { "Hello } \mathrm{Nr} . "+5
\end{aligned}
\]

Numbers and strings are used in the same calculation. So the addition operator is interpreted as addition and not as concatenation.

\footnotetext{
Information
To avoid this error you can convert strings into numbers first (or vice versa). You can use the Convert object for this.
}

\section*{Error 13: ERROR_FLOATERROR}

\section*{Description}

This error occurs if a floating point operation was invalid. This could happen with (invalid) floating point numbers which are read from a file.

\section*{Error 14: ERROR_FLOATLENGTH}

\section*{Description}

This error occurs if a number (in text form), which is longer than 13 chars, is being converted into a floating point number.

\section*{Example of the error}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{f}[1]=1234567890.1234567890
\end{aligned}
\]

The number has 10 integer places and 10 decimal places. In sum this are 20 places. This are more than the maximum allowed 13 places.

\section*{Error 15: ERROR_DIVISIONBYZERO}

\section*{Description}

This error occurs if it is tried to divide trough zero. This is (depending on the laws of mathematics) not possible. In theory it is possible to subtract zero infinite times from any number.

\section*{Example of the error}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1] /=0
\end{aligned}
\]

\section*{Error 16: ERROR_STRINGFORMAT}

\section*{Description}

This error occurs if it is tried to convert a string into a number which has an invalid format (this means it doesn't contain (only) a number).

\section*{Example of the error}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { "Number: 12345" }
\end{aligned}
\]

The string "Number: 12345" is not a number. Instead "12345" whould be valid.

\section*{Error 17: ERROR_STRINGRANGE}

\section*{Description}

This error occurs if it is tried to access a position which exceeds the length of a string.

\section*{Example of the error}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \mathrm{v}[1]=\text { String.Ord("Hello", 5) }
\end{aligned}
\]

The string "Hello" has a length of 5 chars. It is tried to access the sixth char (= position 5) with the Ord method.

\section*{Error 18: ERROR_PICTURE}

\section*{Description}

This error occurs if it is tried to access a picture property, which is only available if the picture has been loaded (e. g. the pixels of a picture).

\section*{Example of the error}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\operatorname{Picture[1].Pixel[0,~0]}
\end{aligned}
\]

If there is no picture loaded as id 1 this will raise an error.

\section*{Error 19: ERROR_PIXELRANGE}

\section*{Description}

This error occurs if it is tried to access some pixel which exceed the picture's boundaries.

\section*{Example of the error}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{v}[1]=\text { Picture[1].FillRect(0, 0, 100, 100) }
\end{aligned}
\]

The error whould occur if the Picture no. 1 whould be smaller than 100 x 100 pixels (e. g. if the picture has a size of \(20 \times 20\) pixels).

\section*{Error 20: ERROR_SAMEPICTURE}

\section*{Description}

This error occurs if it is tried to copy an area from one picture to the same picture.

\section*{Example of the error}
```

1 \$
2 Picture[1].CopyRect(0, 0, 1, 0, 0, 100, 100)

```

The error whould occur because the source picture ( \(=1\) ) is the same as the destination picture (= 1).

\section*{Information}

To avoid this problem you could load the same picture two times. Then you could copy the area from one picture to the other and then erase the copy.

\section*{Error 21: ERROR_PALETTERANGE}

\section*{Description}

This error occurs if it is tried to access a palette entry outside the range of 0 to 255 .

\section*{Example of the error}
```

1 \$
2 Picture[1].Palette[256] = 0xFF

```

The palette entry with the index 256 doesn't exist.

\section*{Error 22: ERROR_SOCKETSTARTUP}

\section*{Description}

This error whould occur if it is not possible to initialize the socket system. This is an error of the target system, where the game is running. The reason for this error could be a wrong winsock version or an invalid network driver.

\section*{Error 23: ERROR_NOFREESOCKET}

\section*{Description}

This error occurs if there is no more free socket to accept an incoming connection.

\section*{Error 24: ERROR_CANTCREATESOCKET}

\section*{Description}

This error occurs if it is not possible to create a socket. This is an error of the target system, where the game is running. The reason for this error could be insufficient resources.

\section*{Error 25: ERROR_SOCKETSTILLOPEN}

\section*{Description}

This error occurs if it is tried to connect an already connected socket.

\section*{Example of the error}
```

1 \$
2 Client[0].Connect("127.0.0.1",
3 SOCK_DESTINY);
Client[0].Connect("127.0.0.1", SOCK_DESTINY)

```

If we assume that the first connection whould be established then the second try to establish a connection whould raise this error. To avoid this error it is satisfactory to close the socket with the Close method before the connection is being established.

\section*{Error 26: ERROR_SOCKETNOTOPEN}

\section*{Description}

This error occurs if it is tried to do an operation which requires a connected socket.

\section*{Example of the error}
```

1 \$
2 Client[0].Close();
3 Client[0].SendVariable(1, 1)

```

The error whould occur in line 3 , because the socket is closed (line 2). Hence it is not possible to send dara.

\section*{Error 27: ERROR_CANTCONNECT}

\section*{Description}

This error occurs if it was not possible to establish a connection.

\section*{Example of the error}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { Client[0]. Connect ("255.255.255.255", } \\
& \text { SOCK_DESTINY) }
\end{aligned}
\]

It is not possible to connect to the specified address (in this case it is an invalid address).

\section*{Error 28: ERROR_SOCKETTYPE}

\section*{Description}

This error occurs if it is tried to use RAW methods on a DestinySocket or DestinySocket methods on a RAW socket.

\section*{Example of the error}
```

1 \$
2 Client[0].Connect("127.0.0.1",
3 SOCK_DESTINY);
Client[0].SendRawData("Hello", 5)

```

The error whould occur in line 3 because the socket type is DestinySocket and the SendRawData method is only for RAW sockets.

\section*{Error 29: ERROR_SOCKETERROR}

\section*{Description}

This error occurs if the socket system reports an error. This is a problem of the target system, where the game is running. The reason could be insufficient resources.

\section*{Error 30: ERROR_OOB}

\section*{Description}

This error occurs if a DestinySocket receives invalid data (out of band). This could occur if a DestinySocket connects to a RAW socket (or vice versa).

\section*{Information}

The DestinyProtocol has no error handling. Hence a connection must be closed an re-established if such an error occurs. Usually the used TCP/IP protocol avoids the arrival of invalid data packages (because the TCP/IP protocol has its own error handling).

\section*{Error 31: ERROR_STRINGTOOLONG}

\section*{Description}

This error occurs if a string with a length greater than 255 bytes shall be sent over a DestinySocket.

\section*{Example of the error}
```

1 \$
2 Client[0].SendString(1, String.Fill("Bla",
500))

```

The error whould occur because the string, which shall be sent, is greater than 255 bytes (the length is 1500 bytes total).

\section*{Information}

To avoid this error you could split the string into 255 char pieces (e. g. with the SubStr method). Next you send the first piece with the string id. Finally you send the other pieces with id 0. The receiving socket could append all received strings with id 0 to the last string id that was received.

\section*{Error 32: ERROR_NOFREEFILEHANDLE}

\section*{Description}

This error occurs if it is tried to open a file although the used file handle is already open.

\section*{Example of the error}
```

1 \$
2 File[0].Open("Test.txt", FILE_WRITE);
3 File[0].Open("Test2.txt", FILE_WRITE)

```

The error whould occur in line 3 , because the used file handle ( \(=0\) ) is already open (line 2).

\section*{Error 33: ERROR_CANTRESOLVEPATH}

\section*{Description}

This error occurs if it was not possible to resolve the path. This is an error of the target system, but could occur in theory with invalid paths.

\section*{Error 34: ERROR_NOPERMISSION}

\section*{Description}

This error occurs if it was tried to access a file or folder, which is outside of the game directory.

\section*{Example of the error}

\section*{1 \$ \\ 2 Directory.DeleteFile("C:\NTLDR")}

Unless the game is running in \(\mathrm{C}: \backslash\) (and this whould be stupid) this whould raise an error. Otherwise (if this whould be possible) an execution of this command could waste the computer system after a reboot. This is the reason why file/directory access is only allowed inside of the game directory.

\section*{Error 35: ERROR_CANTOPENFILE}

\section*{Description}

This error occurs if an file couldn't be opened. The reason could be that the file is already opened by an other program, because an not existing file is being opened only with read access, because the file name includes invalid chars, ...

\section*{Example of the error}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { File[0]. Open( } \\
& 3 \text { "Filenames may not contain ?.txt", } \\
& \text { FILE_READ) }
\end{aligned}
\]

The error occurs because filenames may not contain question marks.

\section*{Error 36: ERROR_FILENOTOPEN}

\section*{Description}

This error occurs if a method is called which requires an open file handle, but the used file handle is not open.

\section*{Example of the error}
```

1 \$
2 File[0].Close();
3 File[0].WriteRawData(12345, TYPE_DWORD)

```

The error whould occur in line 3, because the file handle is closed (line 2).

\section*{Error 37: ERROR_CANTACCESSFILE}

\section*{Description}

This error occurs if a read/write command on a file handle fails. This depends on the target system, where the game is running. The reason could be insufficient free disk space.

\section*{Error 38: ERROR_CANTCREATEDIR}

\section*{Description}

This error occurs if it was not possible to create a directory. This depends on the target system, where the game is running. The reason could be insufficient free disk space or an other file/directory with the same name already exists.

\section*{Error 39: ERROR_CANTREMOVEDIR}

\section*{Description}

This error occurs if it was not possible to remove a directory. Additionally to reasons of ERROR_CANTCREATEDIR the reason could be that the directory, which shall be removed, isn't empty (so it contains files/directories).

\section*{Error 40: ERROR_CANTRENAMEFILE}

\section*{Description}

This error occurs if it was not possible to rename/move a file/directory. This depends on the target system, where the game is running. The reason could be insufficient free disk space or that already a file/directory exists with the target name.

\section*{Error 41: ERROR_CANTCOPYFILE}

\section*{Description}

This error occurs if it was not possible to copy a file. This depends on the target system, where the game is running. The reason could be insufficient free disk space or that already a file/directory exists with the target name.

\section*{Error 42: ERROR_CANTDELETEFILE}

\section*{Description}

This error occurs if it was not possible to delete a file. This depends on the target system, where the game is running. The reason could be that the file is marked as read-only or that already a file/directory exists with the target name.

\section*{Error 43: ERROR_CANTREADATTRIBUTES}

\section*{Description}

This error occurs if it was not possible to retrieve the attributes of a file/directory. This depends on the target system, where the game is running. The reason could be that the user has not the required rights to access the file/directory.

\section*{Error 44: ERROR_CANTWRITEATTRIBUTES}

\section*{Description}

This error occurs if it was not possible to set the attributes of a file/directory. This depends on the target system, where the game is running. The reason could be that the user has not the required rights to access the file/directory.

\section*{Error 45: ERROR_SEARCHSTILLOPEN}

\section*{Description}

This error occurs if it is tried to open a new directory browsing while an other is still open.

\section*{Example of the error}
```

1 \$
2 Directory.FindFirst("*.*");
3 Directory.FindFirst("*.*")

```

The error whould occur in line 3, because the browsing is still open (since line 2).

\section*{Error 46: ERROR_CANTSTARTSEARCH}

\section*{Description}

This error occurs if it was not possible to open a directory browsing. The reason could be an invalid search pattern or an invalid path.

\section*{Example of the error}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { Directory.FindFirst("|\*.*") }
\end{aligned}
\]

The error occurs because there is no directory with the name | (in fact this is not possible, because a file/directory may not contain | in its name).

\section*{Error 47: ERROR_NOSEARCHSTARTED}

\section*{Description}

This error occurs if it is tried do retrieve the next browse result, but no directory browsing was started.

\section*{Example of the error}
```

1 \$
2 Directory.FindClose();
3a[1] = Directory.FindNext()

```

The error whould occur in line 3, because the directory browsing is closed (line 2).

\author{
< Back \\ 9.20 Directory object \\ 10. Error messages \\ Forward > \\ 11. MessageLink
}

\section*{11. MessageLink}

\section*{Description}

If the MessageLink was embedded into the RPG_RT (for this see the manual of the DestinyPatcher) then are some new placeholders added to the message command. These placeholder can be used to display the content of Destiny.dll scopes. The formatting is similar to the formatting of the Format method of the String object. The differences are that you must add a backslash in the front of the placeholder, an index at the end of the placeholder and that you can use the a-placeholder for strings. All in all you have three additional placeholder with the MessageLink: A for strings, D for dwords and F for Doubles (the placeholders are equal to the identifers of the scopes).
MessageBox:
```

Hello, this is the first string: "\a[1]"
This is the second dword: \d[2]
and this is the third double: \f[3]

```

The formatting of the placeholders looks like the formatting of the default RPG-Maker placeholders. But each of these three placeholders has its own properties.

\section*{The string placeholder}

\section*{Description}

The only special property of the string placeholder is that it doesn't support line breaks. This depends on the RPG_RT which internal handles lines separated. A text, which has usually multiple lines, is shown in a single line. The chars, which indicate a line break, are displayed.

\section*{Example}
\[
\begin{aligned}
& 1 \$ \\
& 2 \mathrm{a}[1]=\text { "Line 1" + CRLF + "Line 2" }
\end{aligned}
\]

MessageBox:
"\a[1]"

At the end the following MessageBox whould be displayed:

As you can see the two chars of a line break (CarriageReturn and LineFeet) are displayed as arrows. If a string shall be displayed over multiple lines then you must split it first. You can use the Pos method and the SubStr method of the String object for this.

\section*{The dword placeholder}

\section*{Description}

This placeholder can display dwords with a minimum number of digits. To do this you simply write the number of digits behind the placeholder.

\section*{Example}
```

1 \$
2d[1] = 1500

```

MessageBox:
\d[1]
\d6[1]
\d2[1]
At the end the following MessageBox whould be displayed:

In the first line the number of digits is determined automatically. In the second line we specified a minimum number of digits which is greater than the required number of digits to display the number. Hence zeros are added to the beginning of the number. In the third line the specified minimum number of digits is exceeded by the required number of digits to display the number. Hence the number is displayed normally.

\section*{The double placeholder}

\section*{Description}

This placeholder can display doubles with a minimum number of integer places and an exact number of decimal places. To do this you simply write the minimum number of digits for the integer places, a dot (as decimal separator) and the exact number of digits for the decimal places.

\section*{Example}
```

1 \$
2f[1] = 123.456

```

MessageBox:
\(\backslash f[1]\)
\(\backslash f 4[1]\)
\(\backslash f 0.2[1]\)
\(\backslash f 4.4[1]\)

At the end the following MessageBox whould be displayed:

In the first line the length of the integer places and the decimal places is determined automatically. In the second line a minimum length is specified for the integer places. The length of the integer places is shorter than the minimum length so zeros are added to the beginning of the number. In the third line we specified minimum 0 digits for the integer places (this is the default option) and exact 2 decimal places. In the fourth line we specified minimum 4 integer places and exact 4 decimal places.

\section*{Information}

If a number is specified that it should not display any decimal places then only integer places will be displayed. This means that even the decimal
|separator will not be displayed. (e. g. \f0.0[1] will display 123 if f[1] is 123.456)

Forward >
10. Error messages 12. Constants

\section*{12. Constants}

\section*{Description}

At different places in DestinyScript specific numbers are required. But some values are hard to memorize. Hence you should use constants (these are names which represent the specified numbers). If you write the name of the constant instead of the number it represents then the result will be the same.

\section*{List of constant groups}

Because the most constants belong together they are grouped here.
\begin{tabular}{||l|l|l|}
\hline \multicolumn{1}{|c|}{ Objects } & Group name & \multicolumn{1}{|c|}{ Short description } \\
\hline Logic & \begin{tabular}{l} 
Switch \\
values
\end{tabular} & The values 0 and 1 \\
\hline \hline Math/Convert & \begin{tabular}{l} 
Angle \\
formats
\end{tabular} & Angle formats for angle methods \\
\hline \hline String & Special chars & \begin{tabular}{l} 
Special chars that you can't write in \\
DestinyScript
\end{tabular} \\
\hline Error & Errors & The error constants \\
\hline Keyboard & \begin{tabular}{l} 
Virtual \\
keycodes
\end{tabular} & \begin{tabular}{l} 
The keys of the keyboard (and the buttons of \\
the mouse)
\end{tabular} \\
\hline Keyboard & Key state & The possible key states \\
\hline Map-/Event & \begin{tabular}{l} 
Special \\
events
\end{tabular} & Special" events (hero, boat, ...) \\
\hline Map-/Event & Directions & Up, down, left and right \\
\hline Picture & Actions & Actions of the pictures \\
\hline Client/Server & Socket state & The possible states of a socket \\
\hline Client/Server & Socket type & The possible types of a socket \\
\hline Client/File & Data types & The data types of the Destiny.dll \\
\hline Server & \begin{tabular}{l} 
Socket \\
choice
\end{tabular} & The next free socket \\
\hline File & File mode & Modes for opening files \\
\hline \hline Directory & \begin{tabular}{l} 
File \\
attributes
\end{tabular} & Attributes of files and directories \\
\hline \hline
\end{tabular}

\section*{Switch values}

\section*{Description}

This constants are very important, because they represent the boolean values.

\section*{Constants}
\begin{tabular}{|l|l|l|}
\hline Constant & Value & Description \\
\hline False & 0 & Switch state: OFF \\
\hline True & 1 & Switch state: ON \\
\hline \hline
\end{tabular}

\section*{Angle formats}

\section*{Description}

This constants define the angle formats. A more specific description can be found at the Sin method of the Math object.

\section*{Constants}
\begin{tabular}{|l|l|l|l|}
\hline Constant & Value & \multicolumn{1}{c|}{ Description } \\
\hline DEG & 1 & For angles with 360 units in a full circle (= degree) \\
\hline RAD & 2 & For angles with \(\pi\) units in a full circla (= radiant) \\
\hline GRAD & 3 & For angles with \(\pi\) units in a full circle (= grad) \\
\hline \hline RPG & 4 & \begin{tabular}{l} 
For angles with 256 units in a full circle ( = RPG-Maker \\
specific)
\end{tabular} \\
\hline \hline
\end{tabular}

\section*{Special chars}

\section*{Description}

This constants define string values, which could not be written in DestinyScript.

\section*{Constants}
\begin{tabular}{|l|l|l|}
\hline Constant & \multicolumn{1}{|c|}{ Value } & \multicolumn{1}{|c|}{ Description } \\
\hline CR & ASCII char no. 13 & CarriageReturn \\
\hline LF & ASCII char no. 10 & LineFeed \\
\hline CRLF & ASCII char 13 and 10 & A line break under windows \\
\hline QUOTE & " & Double quotes \\
\hline \hline
\end{tabular}

\section*{Errors}

\section*{Description}

This constants define the error numbers.

\section*{Constants}
\begin{tabular}{|c|c|c|}
\hline Constant & Value & Description \\
\hline ERROR_UNKNOWN & 0 & See description of the error \\
\hline ERROR_SYNTAX & 1 & See description of the error \\
\hline ERROR_NOVALUE & 2 & See description of the error \\
\hline ERROR_UNKNOWNNAME & 3 & See description of the error \\
\hline ERROR_CONVERT & 4 & See description of the error \\
\hline ERROR_READONLY & 5 & See description of the error \\
\hline ERROR_ARRAYBOUND & 6 & See description of the error \\
\hline ERROR_RANGE & 7 & See description of the error \\
\hline ERROR_MEMORY & 8 & See description of the error \\
\hline ERROR_VALUE & 9 & See description of the error \\
\hline ERROR_BINARYFLOAT & 10 & See description of the error \\
\hline ERROR_CALCSWITCH & 11 & See description of the error \\
\hline ERROR_CALCSTRING & 12 & See description of the error \\
\hline ERROR_FLOATERROR & 13 & See description of the error \\
\hline ERROR_FLOATLENGTH & 14 & See description of the error \\
\hline ERROR_DIVISIONBYZERO & 15 & See description of the error \\
\hline ERROR_STRINGFORMAT & 16 & See description of the error \\
\hline ERROR_STRINGRANGE & 17 & See description of the error \\
\hline ERROR_PICTURE & 18 & See description of the error \\
\hline ERROR_PIXELRANGE & 19 & See description of the error \\
\hline ERROR_SAMEPICTURE & 20 & See description of the error \\
\hline
\end{tabular}
\begin{tabular}{||l|l|l|}
\hline ERROR_PALETTERANGE & 21 & See description of the error \\
\hline ERROR_SOCKETSTARTUP & 22 & See description of the error \\
\hline ERROR_NOFREESOCKET & 23 & See description of the error \\
\hline ERROR_CANTCREATESOCKET & 24 & See description of the error \\
\hline ERROR_SOCKETSTILLOPEN & 25 & See description of the error \\
\hline ERROR_SOCKETNOTOPEN & 26 & See description of the error \\
\hline ERROR_CANTCONNECT & 27 & See description of the error \\
\hline ERROR_SOCKETTYPE & 28 & See description of the error \\
\hline ERROR_SOCKETERROR & 29 & See description of the error \\
\hline ERROR_OOB & 30 & See description of the error \\
\hline ERROR_STRINGTOOLONG & 31 & See description of the error \\
\hline ERROR_NOFREEFILEHANDLE & 32 & See description of the error \\
\hline ERROR_CANTRESOLVEPATH & 33 & See description of the error \\
\hline ERROR_NOPERMISSION & 34 & See description of the error \\
\hline ERROR_CANTOPENFILE & 35 & See description of the error \\
\hline ERROR_FILENOTOPEN & 36 & See description of the error \\
\hline ERROR_CANTACCESSFILE & 37 & See description of the error \\
\hline ERROR_CANTCREATEDIR & 38 & See description of the error \\
\hline ERROR_CANTREMOVEDIR & 39 & See description of the error \\
\hline ERROR_CANTRENAMEFILE & 40 & See description of the error \\
\hline ERROR_CANTCOPYFILE & 41 & See description of the error \\
\hline ERROR_CANTDELETEFILE & 42 & See description of the error \\
\hline ERROR_CANTREADATTRIBUTES & 43 & See description of the error \\
\hline ERROR_CANTWRITEATTRIBUTES & 44 & See description of the error \\
\hline ERROR_SEARCHSTILLOPEN & 45 & See description of the error \\
\hline ERROR_CANTSTARTSEARCH & 46 & See description of the error \\

\section*{Virtual keycodes}

\section*{Description}

This constants define the values for keys. (Usually this whould be much more constants, but they are removed because this constants are for very special keyboard layouts)

\section*{Constants}
\begin{tabular}{||l|l|l|}
\hline \multicolumn{1}{|c|}{ Constant } & Value & \multicolumn{1}{|c|}{ Description } \\
\hline VK_DOWN & 40 & Arrow down key \\
\hline VK_LEFT & 37 & Arrow left key \\
\hline VK_RIGHT & 39 & Arrow right key \\
\hline VK_UP & 38 & Arrow up key \\
\hline VK_CONTROL & 17 & Ctrl key \\
\hline VK_MENU & 18 & Alt key \\
\hline VK_RETURN & 13 & Enter key \\
\hline VK_SHIFT & 16 & Shift key \\
\hline VK_SPACE & 32 & Space \\
\hline VK_LBUTTON & 1 & Left mouse button \\
\hline \hline VK_MBUTTON & 4 & Middle mouse button \\
\hline \hline VK_RBUTTON & 2 & Right mouse button \\
\hline VK_NUMPAD0 & 96 & Numeric pad 0 \\
\hline VK_NUMPAD1 & 97 & Numeric pad 1 \\
\hline VK_NUMPAD2 & 98 & Numeric pad 2 \\
\hline VK_NUMPAD3 & 99 & Numeric pad 3 \\
\hline \hline VK_NUMPAD4 & 100 & Numeric pad 4 \\
\hline VK_NUMPAD5 & 101 & Numeric pad 5 \\
\hline VK_NUMPAD6 & 102 & Numeric pad 6 \\
\hline \hline & & \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|}
\hline |VK_NUMPAD7 & 103 & Numeric pad 7 \\
\hline VK_NUMPAD8 & 104 & Numeric pad 8 \\
\hline VK_NUMPAD9 & 105 & Numeric pad 9 \\
\hline VK_MULTIPLY & 106 & Numeric pad multiply \\
\hline VK_ADD & 107 & Numeric pad add \\
\hline VK_SUBTRACT & 109 & Numeric pad subtract \\
\hline VK_DECIMAL & 110 & Numeric pad decimal separator \\
\hline VK_DIVIDE & 111 & Numeric pad divide \\
\hline VK_0 & 48 & 0 key \\
\hline VK_1 & 49 & 1 key \\
\hline VK_2 & 50 & 2 key \\
\hline VK_3 & 51 & 3 key \\
\hline VK_4 & 52 & 4 key \\
\hline VK_5 & 53 & 5 key \\
\hline VK_6 & 54 & 6 key \\
\hline VK_7 & 55 & 7 key \\
\hline VK_8 & 56 & 8 key \\
\hline VK_9 & 57 & 9 key \\
\hline VK_A & 65 & A key \\
\hline VK_B & 66 & B key \\
\hline VK_C & 67 & C key \\
\hline VK_D & 68 & D key \\
\hline VK_E & 69 & E key \\
\hline VK_F & 70 & F key \\
\hline VK_G & 71 & G key \\
\hline VK_H & 72 & H key \\
\hline VK_I & 73 & I key \\
\hline VK_J & 74 & J key \\
\hline VK_K & 75 & K key \\
\hline VK_L & |76 & L key \\

\hline \hline & & \\
\hline
\end{tabular}

\section*{Key states}

\section*{Description}

This constants are used to specify a key state. This constants can't be used to query a key state!

\section*{Constants}
\begin{tabular}{||l|l|l|}
\hline \multicolumn{1}{|c|}{ Constant } & Value & Description \\
\hline KEYEVENTF_KEYDOWN & 0 & The key is pressed \\
\hline KEYEVENTF_KEYUP & 2 & The key is released \\
\hline \hline
\end{tabular}

\section*{Special events}

\section*{Description}

This constants are used to access special events (hero, boat, ship, airship or the current event) with the Event or Mapevent object.

\section*{Constants}
\begin{tabular}{|l|l|l|}
\hline Constant & Value & \multicolumn{1}{c|}{ Description } \\
\hline THIS & 10005 & The current event \\
\hline HERO & 10001 & The hero event \\
\hline BOAT & 10002 & The boat event \\
\hline \hline SHIP & 10003 & The ship event \\
\hline \hline AIRSHIP & 10004 & The airship event \\
\hline \hline
\end{tabular}

\section*{Directions}

\section*{Description}

This constants are used to identify the direction of an event.

\section*{Constants}
\begin{tabular}{||l|l|l|}
\hline Constant & Value & Description \\
\hline DIR_UP & 0 & Direction: Up \\
\hline DIR_RIGHT & 1 & Direction: Right \\
\hline \hline DIR_DOWN & 2 & Direction: Down \\
\hline DIR_LEFT & 3 & Direction: Left \\
\hline \hline
\end{tabular}

\section*{Actions}

\section*{Description}

This constants are used to identify the action of a picture.

\section*{Constants}
\begin{tabular}{||l|l|l|}
\hline \multicolumn{1}{|c|}{ Constant } & Value & Description \\
\hline ACTION_NONE & 0 & No action \\
\hline ACTION_ROTATION & 1 & Rotation effect \\
\hline ACTION_RIPPLE & 2 & Ripple effect \\
\hline \hline
\end{tabular}

\section*{Socket states}

\section*{Description}

This constants are used to identify the state of a socket (client/server).

\section*{Constants}
\begin{tabular}{||l|l|l|}
\hline \multicolumn{1}{|c|}{ Constant } & Value & \multicolumn{1}{c|}{ Description } \\
\hline STATE_CLOSED & 0 & The socket is closed \\
\hline STATE_CONNECTED & 1 & The (client) socket is connected \\
\hline \hline STATE_LISTENING & 2 & \begin{tabular}{l} 
The (server) socket wait for incoming \\
connections
\end{tabular} \\
\hline STATE_ERROR & -1 & The socket reports an error \\
\hline \hline
\end{tabular}

\section*{Socket type}

\section*{Description}

This constants are used to identify the type of a socket (client/server).

\section*{Constants}
\begin{tabular}{||c|l|l|}
\hline \multicolumn{1}{|c|}{ Constant } & Value & \multicolumn{1}{|c|}{ Description } \\
\hline SOCK_DESTINY & 0 & \begin{tabular}{l} 
The socket is a DestinySocket (hence it uses the \\
DestinyProtocol)
\end{tabular} \\
\hline SOCK_RAW & 1 & \begin{tabular}{l} 
The socket is a RAW socket (hence it uses not a \\
specific protocol)
\end{tabular} \\
\hline
\end{tabular}

\section*{Data types}

\section*{Description}

This constants are used to specify the data types.

\section*{Constants}
\begin{tabular}{|l|l|l|}
\hline \multicolumn{1}{|c|}{ Constant } & Value & Description \\
\hline TYPE_VARIABLE & 1 & Data type: variable \\
\hline TYPE_SWITCH & 2 & Data type: switch \\
\hline TYPE_DWORD & 3 & Data type: dword \\
\hline TYPE_DOUBLE & 4 & Data type: double \\
\hline TYPE_STRING & 5 & Data type: string \\
\hline TYPE_BYTE & 6 & Data type: byte \\
\hline TYPE_WORD & 7 & Data type: word \\
\hline \hline
\end{tabular}

\section*{Socket choice}

\section*{Description}

This constant is used to use the next free socket for incoming connections.

\section*{Constants}
\begin{tabular}{||c||c|c|}
\hline Constant & Value & Description \\
\hline NEXT_FREE_SOCKET & -1 & The next free socket will be used \\
\hline \hline
\end{tabular}

\section*{File modes}

\section*{Description}

This constants are used to specify the mode for opening files. This constants can be combined using the binary OR operator.

\section*{Constants}
\begin{tabular}{||l||l|l|}
\hline \multicolumn{1}{|c|}{ Constant } & Value & \multicolumn{1}{c|}{ Description } \\
\hline \hline FILE_READ & 1 & Data can be read \\
\hline FILE_WRITE & 2 & Data can be written \\
\hline \hline FILE_APPEND & 6 & \begin{tabular}{l} 
Data can be written and the file pointer starts at \\
the end of the file
\end{tabular} \\
\hline
\end{tabular}

\section*{File attributes}

\section*{Description}

This constants are used to specify the attributes of a file/directory. This constants can be combined using the binary OR operator.

\section*{Constants}
\begin{tabular}{||l|l|l||}
\hline \multicolumn{1}{|c|}{ Constant } & Value & \multicolumn{1}{|c|}{ Description } \\
\hline FILE_ATTRIBUTE_ARCHIVE & 32 & \begin{tabular}{l} 
A file/directory has the archive \\
flag
\end{tabular} \\
\hline FILE_ATTRIBUTE_DIRECTORY & 16 & \begin{tabular}{l} 
A "e;thing"e; is a directory and \\
not a file
\end{tabular} \\
\hline FILE_ATTRIBUTE_HIDDEN & 2 & A file/directory is hidden \\
\hline FILE_ATTRIBUTE_NORMAL & 128 & \begin{tabular}{l} 
A file/directory has no special \\
attributes
\end{tabular} \\
\hline \hline FILE_ATTRIBUTE_READONLY & 1 & \begin{tabular}{l} 
A file/directory can only be \\
read
\end{tabular} \\
\hline \hline FILE_ATTRIBUTE_SYSTEM & 4 & \begin{tabular}{l} 
A file/directory is a part of the \\
operating system
\end{tabular} \\
\hline \hline
\end{tabular}

\section*{13. Known bugs}

\section*{Description}

If a method of DestinyScript has not the defined effect then this is a bug (= software error). Some of these bugs depend on the target computer system, where the game is running. Hence here is a list of known bugs and solutions.

\section*{List of known bugs}
\begin{tabular}{||l|l|l|l|}
\hline \multicolumn{1}{|c|}{ Object } & Methods & \begin{tabular}{c} 
Source of \\
error
\end{tabular} & \multicolumn{1}{|c|}{ Short description } \\
\hline Game & \begin{tabular}{l} 
Save / \\
Load
\end{tabular} & RPG_RT.exe & \begin{tabular}{l} 
The game crashes if it can't read/write \\
a save file
\end{tabular} \\
\hline \hline Picture & X / Y & RPG_RT.exe & \begin{tabular}{l} 
The game crashes if the coordinates \\
are too huge
\end{tabular} \\
\hline Server & Listen & \begin{tabular}{l} 
Operating \\
system
\end{tabular} & Incoming connections are blocked \\
\hline \begin{tabular}{l} 
Alle mit \\
Index
\end{tabular} & Alle & User & The game crashes on invalid indices \\
\hline \hline
\end{tabular}

\section*{Game.Save / Game.Load}

\section*{Source of error}

RPG_RT.exe

\section*{Problem}

This is a bug which can occur if it was not possible to save/load a game. In this case the game will crash. The filename of a save file is quot;SaveXX.lsd", whereas XX is the respective save slot with two digits (e. g. "Save01.lsd"). If the game crashes during save then the save file is probably read-only. If the game crashes during load then the file probably doesn't exist (or that the save file is corrupt).

\section*{Solution}

To check if the save file can be read/written you can simply open it with the Open method of the File object. If the opening works then you can probably save/load the save file.

\section*{Picture.X / Picture. Y}

\section*{Source of error}

RPG_RT.exe

\section*{Problem}

If a picture has too huge coordinates then the game will crash (e. g. \(\mathrm{X}=\) 5000 or \(\mathrm{Y}=-5000\) ).

\section*{Solution}

If a graphic shall simply not be displayed then you can place it a little bit out of the visible range of the screen. Otherwise you could split the file into small pieces and move the small pieces using DestinyScript.

\section*{Server.Listen}

\section*{Source of error}

\author{
Betriebssystem
}

\section*{Problem}

This is an error which can occur with firewalls (this includes all operating systems since Windows XP, which includes a firewall). All incoming connections are blocked by the firewall.

\section*{Solution}

To solve this problem you must specify that the program/port may accept incoming connections. For Windows firewalls you can use the manual on Microsoft.com. If you have an external firewall (router, etc.) you must enable the "port forwarding"e;.

\section*{All objects with index}

\section*{Source of error}

User

\section*{Problem}

This problem occurs if an invalid index is used with objects of the RPG_RT. For example if you try to change the properties of the hero with the id 0 (the first hero id is usually 1). In such a case the game will crash.

\section*{Solution}

To solve this problem you must look out to use valid indices.
\begin{tabular}{lr} 
< Back12. Constants & Forward > \\
& 13. Known bugs
\end{tabular}

\section*{14. Appendix}

\section*{Description}

Here shall some technical details about the Destiny.dll be descripted. Currently this is only the design of the DestinyProtocol.

\section*{DestinyProtocol}

\section*{Description}

The DestinyProtocol has been developed by Bananen-Joe for the RPGMaker. It offers the basic functions for transmitting variables, switches, dwords, doubles, words, bytes and strings. These are all associated with an id.

\section*{Assembly of a DestinyProtocol command}

XX IIIIIIII VV...
The assembly is simple. At first there will be 1 byte sent as command (red). This command decides the format and the length of the value. The first parameter of the command is a dword value (little endian), which contains the associated id (blue). The second parameter of the command contains the value of the data type (purple).

\section*{List of the DestinyProtocol commands}
\begin{tabular}{|c|c|c|c|}
\hline Command (byte) & Size (of the value) & Format (value) & Description \\
\hline V & 4 & Dword, little endian (= 4 bytes total) & A variable is sent \\
\hline S & 0 & none (= 0 bytes total) & A switch is sent with value 1 (True) \\
\hline S & 0 & none (= 0 bytes total) & A switch is send with value 0 (False) \\
\hline D & 4 & Dword, little endian (= 4 bytes total) & A dword is sent \\
\hline F & 8 & Double, little endian (= 8 bytes total) & A double is sent \\
\hline W & 2 & Word, little endian (= 2 & A word is sent \\
\hline
\end{tabular}
\begin{tabular}{||l||l||l||}
\multicolumn{1}{l|}{} & & bytes total \()\) \\
\hline B & 1 & Byte \((=1\) byte total \()\) \\
\hline A byte is sent \\
\hline A & \(1+\mathrm{n}\) bytes & See string format \\
\hline
\end{tabular}

\section*{String format}

The string format doesn't contain numbers. Hence the first byte (after the index) specifies the length of the string. The following bytes are the string. Here you can see the weakness of the format: strings, that are longer than 255 bytes, can't be sent with this format. But this is intended, because the interal buffer of the Destiny.dll has a maximum size of 500 bytes.
Otherwise, if the strings could be longer than 500 bytes, it whould not be possible to check if the entire string has been received. This was the simpliest solution to ensure that not too much memory is required.
Furthermore the developer of the code was lazy here. :-)

\section*{Examples}

\section*{SendVariable}
```

1 \$
2 Client[0].SendVariable(1, 2)

```

The SendVariable example whould create the following data package (HexDump):
560100000002000000

\section*{SendSwitch}
```

1 \$
2 Client[0].SendSwitch(100, True);
3 Client[0].SendSwitch(-200, False)

```

The SendSwitch example whould create the following data package (HexDump):
```

53 64 00 00 00
73 38 FF FF FF

```

\section*{SendDword}
```

1 \$
2 Client[0].SendDword(10000, 0x12345678)

```

The SendDword example whould create the following data package (HexDump):
\begin{tabular}{llllllll}
44 & 10 & 27 & 00 & 00 & 78 & 56 & 34 \\
12
\end{tabular}

\section*{SendDouble}
```

1 \$
2 Client[0].SendDouble(0xAABBCCDD, Math.Pi)

```

The SendDouble example whould create the following data package (HexDump):
```

46 DD CC BB AA 18 2D 44 54 FB 21 09 40

```

\section*{SendWord}
```

1 \$
2 Client[0].SendWord(0x987654, 100)

```

The SendWord example whould create the following data package (HexDump):
```

57 54 76 98 00 64 00

```

\section*{SendByte}
```

1 \$
2 Client[0].SendByte(0xD0C0B0A0, 3)

```

The SendByte example whould create the following data package (HexDump):
\[
42 \text { A0 B0 C0 D0 } 03
\]

\section*{SendString}
\[
\begin{aligned}
& 1 \text { \$ } \\
& 2 \text { Client [0].SendString(1111111, "Hello") } \\
& \hline
\end{aligned}
\]

The SendString example whould create the following data package (HexDump):
\begin{tabular}{|llllllllllll|}
\hline 41 & 47 & F4 & 10 & 00 & 05 & 48 & 65 & \(6 C\) & \(6 C\) & \(6 F\) & \\
\hline \begin{tabular}{llllllll} 
< Back \\
13. Known bugs
\end{tabular} & & & & 14. Appendix & & Forward \(>\) \\
\hline
\end{tabular}

\section*{15. Closing words}

As the great end of this manual I want to add a review about the DestinyPatch and its development. Since some years I had the idea to develop a patch for the RPG-Maker, but at that time I had not the required knowledge. I had tried to create a solution with a second exe file, which modifies the memory of the real exe file. This solution has a lot of problems (not only due to the performance). For example the memory addresses differ in the RPG_RT depending on the number of variables allocated, etc.. An other problem whould be the parallel monitoring of memory. This could make trouble on slow computer systems.

At that time I had the idea that a patch, which could read the content of the comment command, whould be optimal. This whould have the advantage that each command, which shall be executed by the patch, is entered into the RPG-Maker. And further that the patch is working serial (so the RPGMaker whould make a pause during the execution of a patch command). Three years later (end of the year 2005 - at that time I had gathered much more knowledge about exe files and learned the programming language Assembler) I picked up my old idea and started to develop the DestinyPatch. To do this I had disassembled the RPG_RT.exe and patched it by hand (with a hex editor). The patch worked, but it was poor. For example it didn't afford a real formula interpreter. Additionally some functions (like the disabling of the F12 key) made trouble. In my opinion the patch was more an impertinance than a helpful tool. Hence I canceled the DestinyPatch.

At the beginning of 2007 I rediscovered the pleasure of modifing games. I modified a game for a friend (more life, etc.). Hence I resumed the project "Destiny" and completely revised. But this time I used more structure! For example I created some structograms for the formula interpreter. This eases the work enormously. Additionally I solved the problems like the F12 key thingy on the first start-up. Sometimes it is useful to make a (short) break. The entire year 2007 I worked continously (this means at leas 1 hour per week) on the patch until it was ready at the end of 2007.

The most difficult part of the project was the development of the help files. (Writing easily readable text is much more complicated than writing procedures which modify the stack of its own calling procedures). But the documentating of the patch included advantages. Because I noticed some meaningless functions, that could be removed, and some missing functions, that should be added (e. g. the If method). By hindsight some functions, which are from the first project time of 2005, are useless. But I leave them inside because they could be possibly useful (e. g. who needs a arcus secans?!).

Now (Beginning of 2008) the patch is checked ready (for now). I don't know if there will be new versions. (This depends on the requirement of the users). Furthermore some people whould like to have functions, which are hard to include. (For this functions it whould be easier and much more expedient to write an own RPG-Maker).

But for now I wish all people, who want to use the patch (nevertheless to the old RPG-Maker 2000 version) a lot of fun!

\section*{16. Imprint}

The entire DestinyPatch (Destiny.dll and DestinyPatcher) and the help files (DestinyPatcher help file and DestinyScript help file) have been developed by David Gausmann (alias Bananen-Joe). Closing words about the project can be found in the help file for the scripting language (DestinyScript).

If you have questions (which could not be answered with these help files), remarks and critique you can contact the author via his email address: DestinyDLL ette Bananen-Joe.de (You must replace the ette with an at symbol - if you don't understand this please don't contact me!).
Questions send over other ways (other email addresses, messenger, ...) won't be answered and (as far as possible) immediately deleted!

And have a look on my homepage!
http://www.bananen-joe.de/

Have fun - yours sincerely Bananen-Joe.```
